4

1.2. Conformance Terminologies

- 2 In this document, capitalized terms, such as: MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT, MAY, and OPTIONAL, are intended to be interpreted as described in [RFC2119].

2. Introduction

This document specifies an application program interface (API) for printer drivers in the OpenPrinting print environment. The API defined in this specification is meant for use by applications that need to print documents as well as subcomponents of the print system. The API provides an abstraction layer to access the graphics and printing capabilities that a printer supports, either via a printer language or any other means. As a result of this, it becomes possible to use the printer's full potential without the need for detailed knowledge and understanding of each printer model's internals and peculiarities.

The specification defined in this document targets personal devices capable of only raster graphics such as ink-jet printers as well as production systems using high-end laser printers. In particular, this specification provides access to the high level graphics instructions that are available on devices in the latter category, facilitating improved performance.

When an application program prints in the OpenPrinting print environment, the application, either directly or indirectly via supporting libraries, produces "document data". Normally, this kind of document data uses a device independent page description language such as PostScript or Portable Document Format (PDF). When the printing device can not process such device independent document data directly, the printing system will pass this data to a separate piece of software called the "renderer". The renderer interprets the device independent document data and transforms it into a sequence of calls to a printer driver using the API entries defined in this document. Based on these calls, the printer driver produces printer commands that the printing device is able to process. The printer commands produced by the printer driver are then sent to the printing device by the print system, finally resulting in printed output.

The previous paragraph merely explains a typical flow of events in the print process but, apart from a renderer placing the API calls defined here, printer drivers may be called on by other software components as well. In the remainder of this document we will refer to any module calling on the printer driver as the "Caller" and simply use "Driver" when talking about the printer driver.

1

3.1. Coordinate System

2 The origin of the coordinate system as defined and used in this specification
 3 is the physical upper left corner of the media handled by a device. Units of
 4 the coordinate system are based on the device resolution. Positive direction
 5 on the x-axis is from the origin towards the right side of the media, and
 6 positive direction on the y-axis is from the origin towards the bottom of the
 7 media.

8 The type of the coordinate value is a signed fixed point 32 bit value, where
 9 the integer part uses 24 bits and the fractional part 8 bits. The type name is
 10 `opvp_fix_t`.

11 Coordinate values x and y define the horizontal and vertical distance from
 12 the origin to a point on the media. A point with integer coordinate values x
 13 and y is on the intersection of the coordinate system grid. Physical device
 14 pixels are assumed to be printed on the intersections of the grid (Grid
 15 Intersection Model). The relation between coordinate grid and device pixels
 16 is shown in the bottom figure on the right.

1

2

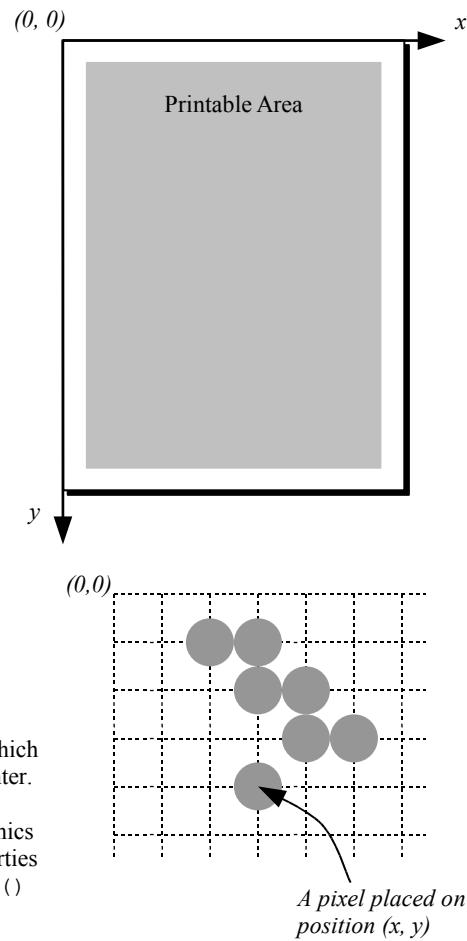

3.2. Graphics State Object

2 For each printer, a printer driver MUST maintain a “Graphics State Object” which
 3 contains properties and drawing attributes used for drawing graphics for a printer.
 4 When calling a printer driver, the caller can specify only one Graphics State
 5 Object to the driver. However, caller and driver MAY maintain multiple Graphics
 6 State Objects to control different printers, and even save and restore the properties
 7 and drawing attributes of each Graphics State Object using the `opvpSaveGS()`
 8 and `opvpRestoreGS()` functions.

9 A graphics State Object MUST provide the following properties and drawing
 10 attributes. Please refer to the description of the related functions for more details
 11 on the properties and drawing attributes.

12

Properties	Related functions
CTM	<code>opvpResetCTM()</code> , <code>opvpSetCTM()</code> , <code>opvpGetCTM()</code>
Clipping region	<code>opvpSetClipPath()</code> , <code>opvpResetClipPath()</code>

13

Drawing Attributes	Related functions
Color space	<code>opvpQueryColorSpace()</code> , <code>opvpSetColorSpace()</code> , <code>opvpGetColorSpace()</code>
Filling mode	<code>opvpSetFillMode()</code> , <code>opvpGetFillMode()</code>
Alpha blending constant	<code>opvpSetAlphaConstant()</code> , <code>opvpGetAlphaConstant()</code>
Stroke line width	<code>opvpSetLineWidth()</code> , <code>opvpGetLineWidth()</code>
Line dash pattern	<code>opvpSetLineDash()</code> , <code>opvpGetLineDash()</code>
Line dash pattern offset	<code>opvpSetLineDashOffset()</code> , <code>opvpGetLineDashOffset()</code>
Line style	<code>opvpSetLineStyle()</code> , <code>opvpGetLineStyle()</code>
Line cap style	<code>opvpSetLineCap()</code> , <code>opvpGetLineCap()</code>
Line join style	<code>opvpSetLineJoin()</code> , <code>opvpGetLineJoin()</code>
Miter limit value	<code>opvpSetMiterLimit()</code> , <code>opvpGetMiterLimit()</code>
Painting mode	<code>opvpSetPaintMode()</code> , <code>opvpGetPaintMode()</code>
Stroke line color	<code>opvpSetStrokeColor()</code>
Fill color	<code>opvpSetFillColor()</code>
Background color	<code>opvpSetBgColor()</code>

1 3.3.CTM

2 A printer driver MUST maintain a Coordinate Transformation Matrix (CTM) with each Graphics State Object. The CTM is
3 used for transformation from the caller's (renderer) coordinate system to the printer's (device) coordinate system. A CTM
4 transforms the renderer coordinates to device coordinates as follows:

$$5 \quad [x_{dev} \quad y_{dev} \quad 1] = [x_{ren} \quad y_{ren} \quad 1] \times \begin{bmatrix} a & b & 0 \\ c & d & 0 \\ e & f & 1 \end{bmatrix}$$

6 To get, set or reset a CTM from the Graphics State Object, use the `opvpGetCTM()`, `opvpSetCTM()`, `opvpResetCTM()`
7 functions.

8

1 3.4.Color

2 The following color spaces are defined by this document.

Color Space Macro	Color Space
<code>OPVP_CSPACE_BW</code>	Black and White
<code>OPVP_CSPACE_DEVICEGRAY</code>	Gray scale
<code>OPVP_CSPACE_DEVICECMY</code>	CMY
<code>OPVP_CSPACE_DEVICECMYK</code>	CMY and Black
<code>OPVP_CSPACE_DEVICERGB</code>	Device RGB
<code>OPVP_CSPACE_DEVICEKRGB</code>	Device KRGB
<code>OPVP_CSPACE_STANDARDRGB</code>	sRGB
<code>OPVP_CSPACE_STANDARDRGB64</code>	scRGB

3
4 A printer driver MUST support at least one of the three color spaces, `OPVP_CSPACE_BW`, `OPVP_CSPACE_DEVICEGRAY`
5 and `OPVP_CSPACE_STANDARDRGB`. Other color spaces are reserved for future extension.

6

1 3.5.Graphics Operations

2 The following graphics operations are defined in this document:

Graphics Operation	Description	Section
Path	Operations for drawing lines, curves, rectangles and other kinds of shapes. A path is maintained as part of a printer context and is shared by all the Graphics State Objects managed by a single printer context. Note: The clipping region is managed by the Graphics State Object, not by the printer context.	4.6
Bitmap Image	Operations for drawing pixel oriented rectangular images.	4.7
Scan Line	Operations for drawing of horizontal lines defined by one or more pairs of begin and end points.	4.8
Raster Image	Operations for drawing whole pages by image instead of using Path Operations and Bitmap Image Operations.	4.9

3
4 The color and color space in effect for "Path" and "Scan Line" operations are controlled via the `opvpSetStrokeColor()`,
5 `opvpSetFillColor()` and `opvpSetBgColor()` functions. "Path" and "Scan Line" operations are not affected by the
6 `opvpSetColorSpace()` function.

7 The image data format for "Bitmap Image" and "Raster Image" operations is dependent on the color space set by the
8 `opvpSetColorSpace()` function.

9 Image data formats for each color space are defined in the following section.

10

1 3.6.Image Data Format

- 2 The following image formats are defined in this document:

Color Space	# of Channels	Bits per Channel	Bits per Pixel	Bytes per Pixel	Note
OPVP_CSPACE_BW	1	1	1	1/8	The MSB corresponds to the left and the LSB to the right pixel in the printed result. Padding bits are added to the rightmost byte if necessary. A bit value of “1” indicates white, a value of “0” indicates black.
OPVP_CSPACE_DEVICEGRAY	1	8	8	1	Maximum luminance value is 0xFF. A value of 0xFF indicates white, 0x00 indicates black.
OPVP_CSPACE_STANDARDRGB	3	8	24	3	The order of the channels is R,G,B,R,G,B,R,G,B... The maximum luminance value of each channel is 0xFF.

1

1 4.1.Creating and Managing Printer Contexts

2 This section defines functions to create and delete printer driver contexts. These functions MUST be supported by all drivers.

3 4.1.1.opvpOpenPrinter

4 Name

5 opvpOpenPrinter – Creates a printer context.

6 Synopsis

```
7     opvp_dc_t opvpOpenPrinter(
8         opvp_int_t outputFD,
9         const opvp_char_t *printerModel,
10        const opvp_int_t apiVersion[2],
11        struct _opvp_api_procs **apiEntry);
```

12 Arguments

13 outputFD – File descriptor to write the printing data stream to.

14 printerModel – Printer model name (UTF-8 encoded).

15 apiVersion – Vector printer driver API version. apiVersion[0] is the major and apiVersion[1] is the minor value
16 of the version respectively.

17 apiEntry – Pointer to a structure which stores all API entries of the driver.

18 Description

19 This function initializes the driver. The caller MUST specify the file descriptor for writing the printing data stream, and the
20 driver MUST write the printing data stream it generates to the file descriptor. The caller may specify a UTF-8 encoded printer
21 model name via printerModel. If the caller passes NULL for printerModel, the driver SHOULD use the default printer
22 model of the driver.

23 The caller MUST set the API version number that it expects from the driver via the apiVersion array. In case the driver
24 does not support the API version that the caller requests, the driver MUST return an error and set the detailed error code to
25 OPVP_VERSIONERROR.

26 The driver may write debugging messages to stderr. Therefore stderr MUST NOT be passed as outputFD by the caller.

27 The driver MUST allocate the struct _opvp_api_procs buffer and store the address of each driver API entry into to
28 corresponding member of apiEntry. If the driver does not support some API entries, it MUST store NULL into the
29 corresponding apiEntry members.

30 This function is the only function that MUST be exported by the driver library. The caller MUST refer to and call any other
31 API entry via the addresses stored in the apiEntry buffer.

32 The printer driver MUST return a printer context as the return value of this function. The printer context MUST be a unique
33 number which is managed by the driver. The caller passes the printer context as the first argument when calling other API
34 entries.

35 Return Value

36 Printer context value (positive value) or -1 in case of error. In the later case, the driver MUST store a detailed error code in
37 opvpErrorNo.

38 4.1.2.opvpClosePrinter

39 Name

40 opvpClosePrinter – Deletes a printer context.

41 Synopsis

```
42     opvp_result_t opvpClosePrinter(
43         opvp_dc_t printerContext);
```

1 **Arguments**

2 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

3 **Description**

4 This function terminates the printing process and deletes the printer context from the printer driver. The caller SHOULD close
5 the file descriptor that was passed as `outputFD` to the `opvpOpenPrinter()` function.

6 The caller should call the `opvpEndJob()` function before calling this function to declare the end of the printing job. If the
7 caller calls this function before a printing job is completed, in other words, if the caller calls this function before calling the
8 `opvpEndJob()` function, the driver should discard all data from the printing data stream for the printing job. In this situation,
9 the driver need not guarantee that the printing job is canceled normally.

10 **Return Value**

11 `OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store a detailed error code in `opvpErrorNo`.

1 4.2.Job, Document and Page Operations

2 This section defines functions to operate job controls. These functions MUST be supported by all drivers. One printing job
3 consists of one or more documents. One document consists of one or more pages. The caller MUST call the
4 `opvpStartJob()` to declare the start of a printing job, and call the `opvpEndJob()` function to declare the end of the
5 printing job for each job. In addition, it MUST call the `opvpStartDoc()` and `opvpEndDoc()` functions for starting and
6 ending of every document, and it also MUST call the `opvpStartPage()` and `opvpEndPage()` functions for starting and
7 ending of every page. However, if a printing job consists of only one document, the caller can omit calling the
8 `opvpStartDoc()` and `opvpEndDoc()` functions.

9 4.2.1.opvpStartJob

10 Name

11 `opvpStartJob` – Declares the start of a printing job.

12 Synopsis

```
13    opvp_result_t opvpStartJob(  
14         opvp_dc_t printerContext,  
15         const opvp_char_t *jobInfo);
```

16 Arguments

17 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

18 `jobInfo` – Printing job property string.

19

20 Description

21 This function declares the start of a printing job.

22 The caller MUST call this function before calling the `opvpStartDoc()` or `opvpStartPage()` functions or any other
23 drawing API entries.

24 The caller can set printing job properties via `jobInfo`. The printer driver MUST keep the given printing job properties until
25 the `opvpEndJob()` function is called. When the caller calls the `opvpStartJob()` function again after calling the
26 `opvpEndJob()` function, the driver MUST override the former `jobInfo` with the new `jobInfo` specified by the latest
27 `opvpStartJob()` function call.

28 If the caller passes `NULL` for the `jobInfo`, the printer driver SHOULD use its default printing job properties. The data format
29 of `jobInfo` is described in the section "Attributes for Job, Document and Page Operations" in this document.

30 It depends on printer and driver capabilities whether nested printing jobs are supported. A nested printing job is one where the
31 `opvpStartJob()` and `opvpEndJob()` functions are called between an enclosing pair of the `opvpStartJob()` and
32 `opvpEndJob()` functions. If a printer or printer driver does not support nested printing jobs, the driver MUST return an error
33 and set the detailed error code to `OPVP_BADREQUEST`.

34 Return Value

35 `OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

36 4.2.2.opvpEndJob

37 Name

38 `opvpEndJob` – Declares the end of a printing job.

39 Synopsis

```
40    opvp_result_t opvpEndJob(  
41         opvp_dc_t printerContext);
```

42 Arguments

43 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

44 Description

45 This function declares the end of a printing job.

1 The caller MUST call this function after it finishes processing a printing job.

2 **Return Value**

3 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

4 4.2.3.opvpAbortJob

5 **Name**

6 opvpAbortJob – Terminates a printing job.

7 **Synopsis**

8

```
opvp_result_t opvpAbortJob(
9                opvp_dc_t printerContext);
```

10 **Arguments**

11 printerContext – Printer context value returned by the opvpOpenPrinter() function.

12 **Description**

13 This function aborts a printing job and returns both the printer and the driver to their initial state. After this function has been called, the next printing job MUST be accepted normally. Whether the driver creates printing data and whether any printing data is sent to the printer is implementation dependent. As a result, this function can not guarantee that no consumables are used.

17 If a caller calls the opvpEndJob() function after calling this function, the driver MUST return an error and set the detailed error code to OPVP_BADREQUEST.

19 **Return Value**

20 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

21 4.2.4.opvpStartDoc

22 **Name**

23 opvpStartDoc – Declares the start of a printing document.

24 **Synopsis**

25

```
opvp_result_t opvpStartDoc(
26                opvp_dc_t printerContext,
27                const opvp_char_t *docInfo);
```

28 **Arguments**

29 printerContext – Printer context value returned by the opvpOpenPrinter() function.

30 docInfo – Printing document property string.

31 **Description**

32 This function declares the start of a printing document.

33 The caller should call this function after calling the opvpStartJob() function, and before calling the opvpStartPage() function or any other drawing API entries. However, if a printing job consists of only one document, the caller can omit calling the opvpStartDoc() and opvpEndDoc() functions.

36 The caller can set document properties via docInfo. The printer driver MUST keep the given document properties until the opvpEndDoc() function is called. When the caller calls the opvpStartDoc() function again after calling the opvpEndDoc() function, the driver MUST override the former docInfo with the new docInfo specified by the latest opvpStartDoc() function call.

40 If the caller passes NULL for the docInfo, the printer driver SHOULD use its default printing document properties. The data format of docInfo is described in the section "Attributes for Job, Document and Page Operations" in this document.

42 It depends on printer and driver capabilities whether nested documents are supported. A nested document is one where the opvpStartDoc() and opvpEndDoc() functions are called between an enclosing pair of opvpStartDoc() and opvpEndDoc() functions. If a printer or printer driver does not support nested documents, the driver MUST return an error and set the detailed error code to OPVP_BADREQUEST.

1

2 **Return Value**

3 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

4 **4.2.5.opvpEndDoc**

5 **Name**

6 opvpEndDoc – Declares the end of a printing document

7 **Synopsis**

```
8     opvp_result_t opvpEndDoc(  
9         opvp_dc_t printerContext);
```

10 **Arguments**

11 printerContext – Printer context value returned by the opvpOpenPrinter() function.

12 **Description**

13 This function declares the end of a printing document.

14 If the caller called the opvpStartDoc() function, it MUST call this function after it finishes processing a document.

15 If a printing job consists of one document, the caller can omit calling the opvpStartDoc() and opvpEndDoc() functions.

16 **Return Value**

17 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

18 **4.2.6.opvpStartPage**

19 **Name**

20 opvpStartPage – Declares the start of a printing page.

21 **Synopsis**

```
22     opvp_result_t opvpStartPage(  
23         opvp_dc_t printerContext,  
24         const opvp_char_t *pageInfo);
```

25 **Arguments**

26 printerContext – Printer context value returned by the opvpOpenPrinter() function.

27 pageInfo – Printing page property string.

28 **Description**

29 This function declares the start of a printing page.

30 The caller MUST call this function after calling the opvpStartJob() and opvpStartDoc() functions, and before calling
31 any other drawing API entries.

32 The caller can set page properties via pageInfo. The printer driver MUST keep the page properties until the
33 opvpEndPage() function is called. When the caller calls the opvpStartPage() function again after calling the
34 opvpEndPage() function, the printer driver MUST override the former pageInfo with the new pageInfo specified
35 by the latest opvpStartPage() function call.

36 If the caller passes NULL as the pageInfo, the printer driver SHOULD use its default page properties. The data format of
37 pageInfo is described in the section "Attributes for Job, Document and Page Operations" in this document.

38 **Return Value**

39 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

1 **4.2.7.opvpEndPage**

2 **Name**

3 opvpEndPage – Declares the end of a printing page.

4 **Synopsis**

```
5    opvp_result_t opvpEndPage(  
6        opvp_dc_t printerContext);
```

7 **Arguments**

8 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

9 **Description**

10 This function declares the end of a printing page.

11 The caller MUST call this function after it finishes processing a page.

12 **Return Value**

13 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

14

1 4.3.Query Operations

2 This section defines functions to query device capabilities and information. Driver support for these functions is OPTIONAL.

3 4.3.1.opvpQueryDeviceCapability

4 Name

5 opvpQueryDeviceCapability – Queries for device capabilities.

6 Synopsis

```
7    opvp_result_t opvpQueryDeviceCapability(
8         opvp_dc_t printerContext,
9         opvp_queryinfoflags_t queryflag,
10        opvp_int_t *buflen,
11        opvp_char_t *infoBuf);
```

12 Arguments

13 printerContext – Printer context value returned by the opvpOpenPrinter() function.

14 queryflag – Flag specifying which device capability to query.

15 buflen – Number of bytes of the buffer pointed to by *infoBuf.

16 infoBuf – Pointer to the buffer to store the device capability.

17 Description

18 This function queries the capabilities that are supported by the printer or driver.

19 The caller MUST set one or more bits of queryflag to query capabilities. The values in the following enumeration should be
20 supported by the driver:

```
21    typedef enum _opvp_queryinfoflags {
22         OPVP_QF_DEVICERESOLUTION               = 0x00000001,
23         OPVP_QF_MEDIASIZE                        = 0x00000002,
24         OPVP_QF_PAGEROTATION                      = 0x00000004,
25         OPVP_QF_MEDIANUP                          = 0x00000008,
26         OPVP_QF_MEDIADUPLEX                       = 0x00000010,
27         OPVP_QF_MEDIASOURCE                       = 0x00000020,
28         OPVP_QF_MEDIADESTINATION                = 0x00000040,
29         OPVP_QF_MEDIATYPE                         = 0x00000080,
30         OPVP_QF_MEDIACOPY                        = 0x00000100, /* Maximum copy number supported */
31         OPVP_QF_PRINTREGION                       = 0x00010000 /* only for opvpQueryDeviceInfo use */
32    } opvp_queryinfoflags_t;
```

33 The driver MUST return the queried capabilities in ASCII text format via the infoBuf buffer, and also return the number of
34 bytes of this text via *buflen. If the buffer is too small to store the query result, the driver MUST return the necessary number
35 of bytes to retrieve the query result in *buflen, return an error and set the detailed error code to OPVP_PARAMERROR. If the
36 caller passes NULL as the infoBuf buffer, the driver MUST return the number of bytes required to store the query result via
37 *buflen.

38 The format of the capability name-value pairs stored in the infoBuf buffer is the same as that of the jobInfo used with the
39 opvpStartJob() function. For example, when querying for the device resolution, a resolution list similar to the following
40 may be returned. The first name-value pair in the list indicates the default.

41 updf:DeviceResolution=deviceResolution_600x600,deviceResolution_1200x1200

42 In case of OPVP_QF_MEDIACOPY, a driver MUST return the maximum MediaCopy number that a printer supports.

45 Return Value

46 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

47 4.3.2.opvpQueryDeviceInfo

48 Name

49 opvpQueryDeviceInfo – Queries for device information.

1 **Synopsis**

```
2    opvp_result_t opvpQueryDeviceInfo(
3     opvp_dc_t printerContext,
4     opvp_queryinfoflags_t queryflag,
5     opvp_int_t *buflen,
6     opvp_char_t *infoBuf);
```

7 **Arguments**

8 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

9 queryflag – Flag specifying which device information to query.

10 buflen – Number of bytes of the buffer pointed to by `*infoBuf`.

11 infoBuf – Pointer to the buffer to store the device information.

12 **Description**

13 This function queries for information about the current settings of the printer or driver.

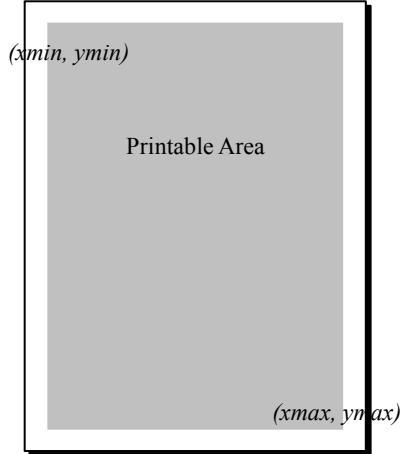

14
15 The caller MUST set one or more bits of `queryflag` to query for information. Values of the same enumeration used for the
16 `opvpQueryDeviceCapability()` function MUST be used.

17
18 The driver MUST return the queried information in ASCII text format into the `infoBuf` buffer, and also return the number of
19 bytes of this text via `*buflen`. If the buffer is too small to store the query result, the driver MUST return the necessary number
20 of bytes to retrieve the query result in `*buflen`, return an error and set the detailed error code `OPVP_PARAMERROR`. If the
21 caller passes NULL as the `infoBuf` pointer, the driver MUST return the number of bytes required to store the query result via
22 `*buflen`.

23 The format of the information name-value pairs stored in the `infoBuf` buffer is the same as that of the `jobInfo` used with
24 the `opvpStartJob()` function.

25 When the caller sets the `OPVP_QF_PRINTREGION` bit of the `queryflag`, the driver MUST provide the printable area using
26 the current resolution setting. The printable area format MUST be as given below. The values correspond to the *x* and *y*
27 coordinates of the left top and right bottom corners, respectively, of the current printable area setting as shown in the figure.
28 These values depend on the current media orientation setting.

29 PrintRegion=xmin,ymin,xmax,ymax

41 **Return Value**

42 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

1 4.4.Attributes for Job, Document and Page Operations

2 Attributes for printing jobs, documents and pages can be passed as arguments to the `opvpStartJob()`, `opvpStartDoc()`
3 and `opvpStartPage()` functions. Supported attributes are provided by a printer driver database file distributed with the
4 driver.

5 Attribute names and values MUST be specified as ASCII strings in the following format;

6
7 `<scheme>:<key>=<value>{,<value>}*{;<key>=<value>{,<value>}*{}`
8 • `<scheme>`: Name space for the following `<key>` and `<value>`.
9 • `<key>`: Name of the attribute.
10 • `<value>`: Value for given `<key>`.

11
12 Multiple `<value>`s for a `<key>` MUST be separated by a "," (comma). When multiple values are specified for a single key, the
13 printer driver should search the list of values starting with the first value and use the first value that the driver can use with the
14 current settings.

15 Multiple key-value pairs, `<key>=<value>{,<value>}*`, MUST be separated by a ":" (semi-colon).

16 Conforming drivers MUST support a "updf" `<scheme>` as defined in IEEE-ISTO PWG 5101.4 "Universal Printer Definition
17 Format" (May 2004) developed by the Printer Working Group.

18 Conforming drivers MUST ignore unknown properties to maintain compatibility with future vendor or standard extensions.

19 Major UPDF attributes are shown in the table below:

Attribute	Name	Value	Effective in		
			Job	Doc	Page
Orientation	MediaPageRotation	landscape portrait reverse-landscape reverse-portrait	✓	✓	✓
Page Size	MediaSize	iso_a4_210x297mm iso_a3_297x420mm jpn_hagaki_100x148mm ...	✓	✓	✓
Number Up	MediaNUp	nup-1x1 nup-2x1 nup-2x2 ...	✓	✓	✓
Duplex	MediaDuplex	simplex duplex-long-edge duplex-short-edge	✓	✓	✓
Resolution	DeviceResolution	deviceResolution_1200x1200 deviceResolution_600x600 ...	✓	✓	✓
input-bin	MediaSource	manual continuous roll cut-sheet proprietary-value device-setting	✓	✓	✓
output-bin	MediaDestination	standard proprietary-value device-setting	✓	✓	✓
Media Type	MediaType	cardstock continuous stationery stationery-fine ...	✓	✓	✓
Media Copy	MediaCopy	1, 2, ...	✓	✓	
Print Quality	PrintQuality	draft high normal	✓	✓	✓

1 Between `opvpStartPage()` and `opvpEndPage()` function calls, page attributes take precedence over document
2 attributes. Similarly, between `opvpStartDoc()` and `opvpEndDoc()` function calls, document attributes take precedence
3 over job attributes. For example, a three page job with a landscape orientation attribute passed to the `opvpStartJob()`
4 function and a portrait orientation attribute passed to the `opvpStartPage()` function for its second page will use a landscape
5 orientation for the first page and third page but the second will use portrait.

6

1 4.5.Graphics State Object Operations

2 This section defines functions that operate on the properties or drawing attributes of a Graphics State Object. Driver support for
3 any of these functions is OPTIONAL.

4 4.5.1.opvpResetCTM

5 **Name**

6 opvpResetCTM – Initializes the CTM of a Graphics State Object.

7 **Synopsis**

```
8    opvp_result_t opvpResetCTM(  
9         opvp_dc_t printerContext);
```

10 **Arguments**

11 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

12 **Description**

13 This function initializes the CTM of a Graphics State Object. The initial value of a CTM is the identity matrix:

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

15 **Return Value**

16 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

17 4.5.2.opvpSetCTM

18 **Name**

19 opvpSetCTM – Sets the CTM of a Graphics State Object.

20 **Synopsis**

```
21    opvp_result_t opvpSetCTM(  
22         opvp_dc_t printerContext,  
23         const opvp_ctm_t *pCTM);
```

24 **Arguments**

25 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

26 pCTM – Pointer to an `opvp_ctm_t` structure holding the six CTM elements a, b, c, d, e and f.

27 **Description**

28 This function sets the CTM of a Graphics State Object.

29 The printer (device) coordinate system coordinates $[x_{dev}, y_{dev}]$ and the caller (renderer) coordinate system coordinates
30 $[x_{ren}, y_{ren}]$ are related via the CTM as shown in the following equation:

$$31 \begin{bmatrix} x_{dev} & y_{dev} & 1 \end{bmatrix} = \begin{bmatrix} x_{ren} & y_{ren} & 1 \end{bmatrix} \times \begin{bmatrix} a & b & 0 \\ c & d & 0 \\ e & f & 1 \end{bmatrix}$$

32 **Structures**

```
33    typedef struct _opvp_ctm {  
34         opvp_float_t a, b, c, d, e, f;  
35    } opvp_ctm_t;
```

1 **Return Value**

2 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

3 **4.5.3.opvpGetCTM**

4 **Name**

5 opvpGetCTM – Gets the CTM of a Graphics State Object.

6 **Synopsis**

```
7    opvp_result_t opvpGetCTM(  
8         opvp_dc_t printerContext;  
9         opvp_ctm_t *pCTM);
```

10 **Arguments**

11 printerContext – Printer context value returned by the opvpOpenPrinter() function.

12 pCTM – Pointer to an opvp_ctm_t structure to receive the six CTM elements a, b, c, d, e and f.

13 **Description**

14 This function gets the CTM of a Graphics State Object.

15 **Structures**

```
16    typedef struct _opvp_ctm {  
17         opvp_float_t a, b, c, d, e, f;  
18    } opvp_ctm_t;
```

19 **Return Value**

20 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

21 **4.5.4.opvpInitGS**

22 **Name**

23 opvpInitGS – Initializes the parameters of a Graphics State Object.

24 **Synopsis**

```
25    opvp_result_t opvpInitGS(  
26         opvp_dc_t printerContext);
```

27 **Arguments**

28 printerContext – Printer context value returned by the opvpOpenPrinter() function.

29 **Description**

30 This function initializes the parameters of the currently active Graphics State Object. The Graphics State is a set of values
31 managed by the printer driver and contains parameters for drawing color, drawing mode and other, drawing related, settings.
32 The driver MUST keep the current parameters of a Graphics State Object unless opvpInitGS() or other parameter setting
33 functions are called. Also, the driver MUST save all parameters in the Graphics State Object onto the driver's stack when the
34 caller calls the opvpSaveGS() function, and restore all parameters from the stack to the Graphics State Object when the caller
35 calls the opvpRestoreGS() function. These two functions are described later in this document. These operations are used to
36 change the parameters in the Graphics State Object temporarily and restore them after drawing operations.

37 The driver MUST keep the Graphics State Object parameters between opvpStartJob() and opvpEndJob(), unless
38 opvpInitGS() or other parameter setting functions are called. When the caller calls the opvpStartJob() function, the
39 driver MUST set the same parameters as the opvpInitGS() sets.

40 **Return Value**

41 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

1 **4.5.5.opvpSaveGS**

2 **Name**

3 opvpSaveGS – Saves the Graphics State Object parameters.

4 **Synopsis**

```
5   opvp_result_t opvpSaveGS(  
6        opvp_dc_t printerContext);
```

7 **Arguments**

8 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

9 **Description**

10 This function saves the Graphics State Object parameters onto the driver's stack.

11

12

13 **Return Value**

14 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

15 **4.5.6.opvpRestoreGS**

16 **Name**

17 opvpRestoreGS – Restores Graphics State Object parameters.

18 **Synopsis**

```
19   opvp_result_t opvpRestoreGS(  
20        opvp_dc_t printerContext);
```

21 **Arguments**

22 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

23 **Description**

24 This function retrieves Graphics State Object parameters from the driver's stack and restores them into the current Graphics
25 State Object.

26 This function MUST return error and set the error code `OPVP_BADREQUEST` in `opvpErrorNo` if the stack is empty.

27 **Return Value**

28 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

29 **4.5.7.opvpQueryColorSpace**

30 **Name**

31 opvpQueryColorSpace – Queries the driver for supported color spaces.

32 **Synopsis**

```
33   opvp_result_t opvpQueryColorSpace(  
34        opvp_dc_t printerContext,  
35        opvp_int_t *pnum,  
36        opvp_cspace_t *pcspace);
```

37 **Arguments**

38 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

39 pnum – Number of elements in `pcspace`.

40 pcspace – Pointer to an array of supported color spaces.

1 **Description**

2 This function queries the driver for a list of supported color spaces.

3
4 To query for the supported color spaces , the caller MUST set the number of pcspc elements into *pnum. In this case, the
5 driver MUST return the supported color spaces in the pcspc array and also return the number of supported color spaces
6 retrieved in *pnum.

7 If the caller sets NULL in *pcspc, the driver MUST return only the number of supported color spaces in *pnum.

8 If the number of supported color spaces exceeds the number of pcspc array elements prepared by the caller, the driver
9 MUST return the necessary number to retrieve all supported color spaces in *pnum, return an error and set the detailed error
10 code to OPVP_PARAMERROR.

11 The driver SHOULD return the supported color spaces in order of preference. The first supported color spaces is the most
12 preferred color space for the driver.

13 **Return Value**

14 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

15 **4.5.8.opvpSetColorSpace**

16 **Name**

17 opvpSetColorSpace – Sets the color space of a Graphics State Object.

18 **Synopsis**

```
19       opvp_result_t opvpSetColorSpace(  
20            opvp_dc_t printerContext,  
21            opvp_cspace_t cspace);
```

22 **Arguments**

23 printerContext – Printer context value returned by the opvpOpenPrinter() function.

24 cspace – Color space value.

25 **Description**

26 This function sets the color space of a Graphics State Object.

27 The color space passed by the caller via cspace MUST be one of the color spaces returned by the
28 opvpQueryColorSpace() function.

29 **Return Value**

30 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

31 **4.5.9.opvpGetColorSpace**

32 **Name**

33 opvpGetColorSpace – Gets the current color space from a Graphics State Object.

34 **Synopsis**

```
35       opvp_result_t opvpGetColorSpace(  
36            opvp_dc_t printerContext,  
37            opvp_cspace_t *pcspace);
```

38 **Arguments**

39 printerContext – Printer context value returned by the opvpOpenPrinter() function.

40 pcspc – Pointer to the color space value to be returned.

41 **Description**

42 This function gets the color space that is currently set in a Graphics State Object.

43

1 The initial color space of a Graphics State Object is driver dependent.

2 **Return Value**

3 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

4 **4.5.10.opvpSetFillMode**

5 **Name**

6 opvpSetFillMode – Sets the filling mode of a Graphics State Object.

7 **Synopsis**

```
8     opvp_result_t opvpSetFillMode(  
9         opvp_dc_t printerContext,  
10        opvp_fillmode_t fillmode);
```

11 **Arguments**

12 printerContext – Printer context value returned by the opvpOpenPrinter() function.

13 fillmode – Filling mode enumeration value. OPVP_FILLMODE_EVENODD (even-odd rule) and
14 OPVP_FILLMODE_WINDING (non-zero winding number rule) can be set.

15 **Description**

16 This function sets the filling mode of a Graphics State Object.

17 **Return Value**

18 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

19 **4.5.11.opvpGetFillMode**

20 **Name**

21 opvpGetFillMode – Gets the filling mode from a Graphics State Object.

22 **Synopsis**

```
23     opvp_result_t opvpGetFillMode(  
24         opvp_dc_t printerContext,  
25        opvp_fillmode_t *pfillmode);
```

26 **Arguments**

27 printerContext – Printer context value returned by the opvpOpenPrinter() function.

28 pfillmode – Pointer to the fill mode enumeration value to be returned.

29 **Description**

30 This function gets the filling mode that is currently set in a Graphics State Object.

31 The initial filling mode of a Graphics State Object is driver dependent.

32

33 **Return Value**

34 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

35 **4.5.12.opvpSetAlphaConstant**

36 **Name**

37 opvpSetAlphaConstant – Sets the alpha blending constant of a Graphics State Object.

38 **Synopsis**

```
39     opvp_result_t opvpSetAlphaConstant(  
40         opvp_dc_t printerContext,  
41        opvp_float_t alpha);
```

1 **Arguments**

2 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

3 alpha – Alpha blending constant. This MUST be a value between 0.0 and 1.0.

4 **Description**

5 This function sets the alpha blending constant, which is transparent ratio, of a Graphics State Object. The value of `alpha`
6 MUST be between 0.0 and 1.0. If the value specified by the caller is outside of this range, the driver SHOULD use the nearest
7 value that is within range.

8 **Return Value**

9 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

10 **4.5.13.opvpGetAlphaConstant**

11 **Name**

12 `opvpGetAlphaConstant` – Gets the alpha blending constant from a Graphics State Object.

13 **Synopsis**

```
14    opvp_result_t opvpGetAlphaConstant(  
15        opvp_dc_t printerContext,  
16        opvp_float_t *palpha);
```

17 **Arguments**

18 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

19 `palpha` – Pointer to the alpha constant value to be returned.

20 **Description**

21 This function gets the alpha constant value that is currently set in a Graphics State Object.

22 The initial alpha blending constant of a Graphics State Object is driver dependent.

23

24 **Return Value**

25 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

26 **4.5.14.opvpSetLineWidth**

27 **Name**

28 `opvpSetLineWidth` – Sets the line width of a Graphics State Object.

29 **Synopsis**

```
30    opvp_result_t opvpSetLineWidth(  
31        opvp_dc_t printerContext,  
32        opvp_fix_t width);
```

33 **Arguments**

34 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

35 `width` – Line width value.

36 **Description**

37 This function sets line width for stroke operations by a Graphics State Object. The line width MUST be set in caller coordinate
38 system unit.

39 Treatment of line widths less than one depends on the device or driver implementation. Similarly, the maximum line width that
40 can be set also depends on the device or driver implementation.

41 **Return Value**

42 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

1 4.5.15.opvpGetLineWidth

2 **Name**

3 opvpGetLineWidth – Gets the line width from a Graphics State Object.

4 **Synopsis**

```
5    opvp_result_t opvpGetLineWidth(  
6        opvp_dc_t printerContext,  
7        opvp_fix_t *pwidth);
```

8 **Arguments**

9 printerContext – Printer context value returned by the opvpOpenPrinter() function.

10 pwidth – Pointer to the line width value to be returned.

11 **Description**

12 This function gets the line width for stroke operations from a Graphics State Object. The line width value MUST be in caller
13 coordinate system unit.

14 The initial line width of a Graphics State Object is driver dependent.

15

16 **Return Value**

17 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

18 4.5.16.opvpSetLineDash

19 **Name**

20 opvpSetLineDash – Sets the line dash pattern of a Graphics State Object.

21 **Synopsis**

```
22   opvp_result_t opvpSetLineDash(  
23        opvp_dc_t printerContext,  
24        opvp_int_t num,  
25        const opvp_fix_t *pdash);
```

26 **Arguments**

27 printerContext – Printer context value returned by the opvpOpenPrinter() function.

28 num – Number of elements in pdash.

29 pdash – Pointer to the line dash pattern array.

30 **Description**

31 This function sets a line dash pattern for use by a Graphics State Object.

32 When the painting mode is OPVP_PAINTMODE_OPAQUE (opaque mode), the odd numbered (1st, 3rd, 5th, 7th ...) elements of
33 the pdash array indicate the length for dashes in the color set by the opvpSetStrokeColor() function and the even
34 numbered (2nd, 4th, 6th, 8th ...) elements indicate the length for dashes in the color set by the opvpSetBgColor() function.

35 When the painting mode is OPVP_PAINTMODE_TRANSPARENT (transparent mode), the odd numbered (1st, 3rd, 5th, 7th ...) elements of
36 the pdash array indicate the length for dashes in the color set by the opvpSetStrokeColor() function and the even numbered (2nd, 4th, 6th, 8th ...) elements indicate the length of line segments that are not painted.

38 The lengths set in the pdash array MUST be in caller coordinate system unit.

39 If the number of elements of the pdash array is odd, the dash pattern is created as if the number of elements is double the
40 number of elements of the array. In this case, the first element of the pdash array in the second cycle is treated as the length
41 for background color dashes in case of opaque mode and for non-painted line segments in case of transparent mode.

42 The maximum number of elements that can be set depends on the device or driver implementation.

43 If the caller passes zero for num, the driver MUST draw solid lines.

1 **Return Value**

2 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

3 **4.5.17.opvpGetLineDash**

4 **Name**

5 opvpGetLineDash – Gets the line dash pattern of a Graphics State Object.

6 **Synopsis**

```
7    opvp_result_t opvpGetLineDash(  
8        opvp_dc_t printerContext,  
9        opvp_int_t *pnum,  
10      opvp_fix_t *pdash);
```

12 **Arguments**

13 printerContext – Printer context value returned by the opvpOpenPrinter() function.

14 pnum – Pointer to the number of elements in pdash.

15 pdash – Pointer to the buffer to store the line dash pattern array.

16 **Description**

17 This function gets the line dash pattern from a Graphics State Object.

18 If the caller sets NULL in *pdash, the driver MUST return only the number of the dash pattern elements in *pnum.

19 If the caller sets a non-NULL value in *pdash, the caller MUST also set the number of pdash elements into *pnum. In this
20 case, the driver MUST return the dash pattern in the pdash array and also return the number of dash pattern elements retrieved
21 in *pnum.

22 If the number of dash pattern elements exceeds the number of pdash array elements prepared by the caller, the driver MUST
23 return the necessary number to retrieve all the dash pattern elements in *pnum, return an error and set the detailed error code to
24 OPVP_PARAMERROR.

25 The initial line dash pattern of a Graphics State Object is driver dependent.

26 **Return Value**

27 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

28 **4.5.18.opvpSetLineDashOffset**

29 **Name**

30 opvpSetLineDashOffset – Sets the line dash pattern offset of a Graphics State Object.

31 **Synopsis**

```
32    opvp_result_t opvpSetLineDashOffset(  
33        opvp_dc_t printerContext,  
34        opvp_fix_t offset);
```

35 **Arguments**

36 printerContext – Printer context value returned by the opvpOpenPrinter() function.

37 offset – Offset value of the line dash pattern.

38 **Description**

39 This function sets the offset value of the line dash pattern for stroke operations in caller coordinate system unit.

40 **Return Value**

41 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

1 **4.5.19.opvpGetLineDashOffset**

2 **Name**

3 opvpGetLineDashOffset – Gets the line dash pattern offset of a Graphics State Object.

4 **Synopsis**

```
5   opvp_result_t opvpGetLineDashOffset (
6     opvp_dc_t printerContext,
7     opvp_fix_t *poffset);
```

8 **Arguments**

9 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

10 poffset – Pointer to the offset value of the line dash pattern to be returned.

11 **Description**

12 This function gets the offset value of the line dash pattern from a Graphics State Object.

13 The initial line dash pattern offset of a Graphics State Object is driver dependent.

14

15 **Return Value**

16 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

17 **4.5.20.opvpSetLineStyle**

18 **Name**

19 opvpSetLineStyle – Sets the line style of a Graphics State Object.

20 **Synopsis**

```
21   opvp_result_t opvpSetLineStyle (
22     opvp_dc_t printerContext,
23     opvp_linestyle_t linestyle);
```

24 **Arguments**

25 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

26 linestyle – Line style enumeration value. OPVP_LINESTYLE_SOLID (solid line) and OPVP_LINESTYLE_DASH (dashed line) can be set.

28 **Description**

29 This function sets the line style of a Graphics State Object.

30 **Return Value**

31 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

32 **4.5.21.opvpGetLineStyle**

33 **Name**

34 opvpGetLineStyle – Gets the line style of a Graphics State Object.

35 **Synopsis**

```
36   opvp_result_t opvpGetLineStyle (
37     opvp_dc_t printerContext,
38     opvp_linestyle_t *plinestyle);
```

39 **Arguments**

40 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

41 plinestyle – Pointer to the line style enumeration value to be returned.

1 **Description**

2 This function gets the line style from a Graphics State Object.

3 The initial line style of a Graphics State Object is driver dependent.

4

5 **Return Value**

6 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

7 **4.5.22.opvpSetLineCap**

8 **Name**

9 opvpSetLineCap – Sets the line cap style of a Graphics State Object.

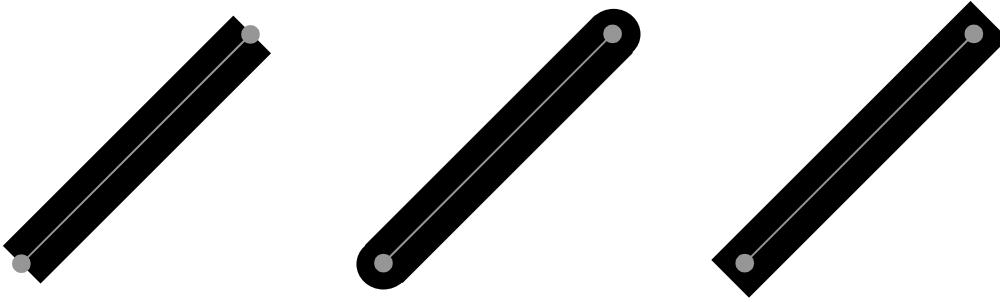

10 **Synopsis**

```
11   opvp_result_t opvpSetLineCap(  
12       opvp_dc_t printerContext,  
13       opvp_linecap_t linecap);
```

14 **Arguments**

15 printerContext – Printer context value returned by the opvpOpenPrinter() function.

16 linecap – Line cap style enumeration value. OPVP_LINECAP_BUTT (butt cap), OPVP_LINECAP_ROUND (round cap)
17 and OPVP_LINECAP_SQUARE (square projection cap) can be set.

Butt cap

Round cap

Square projection cap

20 **Description**

21 This function sets the line cap style of a Graphics State Object.

22 The line cap style specifies the shape at the end of opened paths, and also specifies the shapes at the end of each dashes.

23 **Return Value**

24 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

25 **4.5.23.opvpGetLineCap**

26 **Name**

27 opvpGetLineCap – Gets the line cap style of a Graphics State Object.

28 **Synopsis**

```
29   opvp_result_t opvpGetLineCap(  
30       opvp_dc_t printerContext,  
31       opvp_linecap_t *plinecap);
```

32 **Arguments**

33 printerContext – Printer context value returned by the opvpOpenPrinter() function.

34 plinecap – Pointer to the line cap style enumeration value to be returned.

1 **Description**

2 This function gets the line cap style of a Graphics State Object.

3 The initial line cap style of a Graphics State Object is driver dependent.

4

5 **Return Value**

6 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

7 **4.5.24.opvpSetLineJoin**

8 **Name**

9 opvpSetLineJoin – Sets the line join style of a Graphics State Object.

10 **Synopsis**

```
11   opvp_result_t opvpSetLineJoin(  
12       opvp_dc_t printerContext,  
13       opvp_linejoin_t linejoin);
```

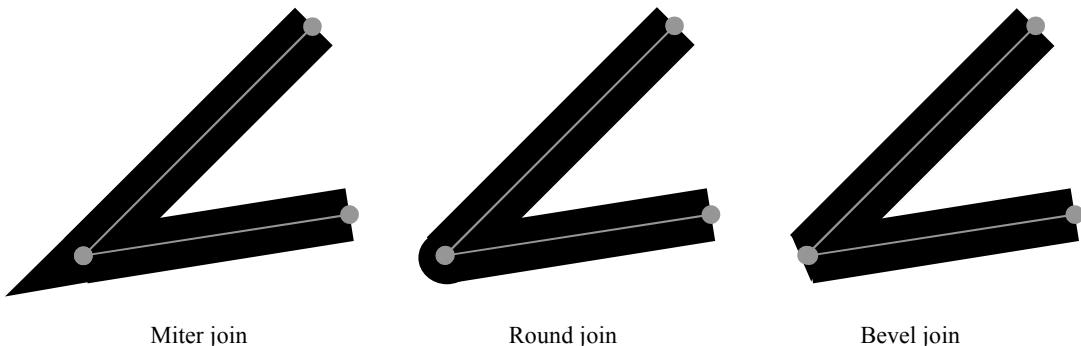

14 **Arguments**

15 printerContext – Printer context value returned by the opvpOpenPrinter() function.

16 linejoin – Line join style enumeration value. OPVP_LINEJOIN_MITER (miter join), OPVP_LINEJOIN_ROUND
17 (round join) and OPVP_LINEJOIN_BEVEL (bevel join) can be set.

18 **Description**

19 This function sets the line join style of a Graphics State Object.

Miter join

Round join

Bevel join

22 **Return Value**

23 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

24 **4.5.25.opvpGetLineJoin**

25 **Name**

26 opvpGetLineJoin – Gets the line join style of a Graphics State Object.

27 **Synopsis**

```
28   opvp_result_t opvpGetLineJoin(  
29       opvp_dc_t printerContext,  
30       opvp_linejoin_t *plinejoin);
```

31 **Arguments**

32 printerContext – Printer context value returned by the opvpOpenPrinter() function.

33 plinejoin – Pointer to the line join style enumeration value to be returned.

34 **Description**

35 This function gets the line join style of a Graphics State Object.

36 The initial line join style of a Graphics State Object is driver dependent.

1

2 **Return Value**

3 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

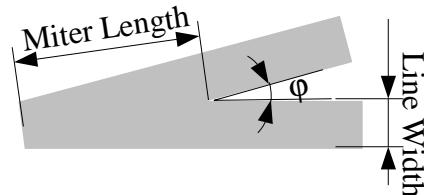

4 **4.5.26.opvpSetMiterLimit**5 **Name**

6 opvpSetMiterLimit – Sets the miter limit value of a Graphics State Object.

7 **Synopsis**8

```
opvp_result_t opvpSetMiterLimit(
9     opvp_dc_t printerContext,
10    opvp_fix_t miterlimit);
```

$$\text{Miter Limit} = \frac{\text{Miter Length}}{\text{Line Width}} = \frac{1}{\sin(\frac{\varphi}{2})}$$

11 **Arguments**12 printerContext – Printer context value returned by the
13 opvpOpenPrinter() function.

14 miterlimit – Maximum miter length.

15 **Description**16 This function sets the maximum length of the miter created by a Graphics State Object. The miter limit is effective only when
17 the line join style is OPVP_LINEJOIN_MITER. The length MUST be set in caller coordinate system unit.18 **Return Value**

19 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

20 **4.5.27.opvpGetMiterLimit**21 **Name**

22 opvpGetMiterLimit – Gets the miter limit value of a Graphics State Object.

23 **Synopsis**24

```
opvp_result_t opvpGetMiterLimit(
25     opvp_dc_t printerContext,
26     opvp_fix_t *pmiterlimit);
```

27 **Arguments**

28 printerContext – Printer context value returned by the opvpOpenPrinter() function.

29 pmriterlimit – Pointer to the maximum miter length to be returned.

30 **Description**

31 This function gets the maximum length of miter of a Graphics State Object.

32 The initial miter limit value of a Graphics State Object is driver dependent.

33

34 **Return Value**

35 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

36 **4.5.28.opvpSetPaintMode**37 **Name**

38 opvpSetPaintMode – Sets the background color painting mode of a Graphics State Object.

39 **Synopsis**40

```
opvp_result_t opvpSetPaintMode(
41     opvp_dc_t printerContext,
```

```
1     opvp_paintmode_t paintmode);
```

2 **Arguments**

3 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

4 paintmode – Painting mode enumeration value. `OPVP_PAINTMODE_OPAQUE` (opaque mode) and
5 `OPVP_PAINTMODE_TRANSPARENT` (transparent mode) can be set.

6 **Description**

7 This function sets the background color painting mode of a Graphics State Object.

8 **Return Value**

9 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

10 **4.5.29.opvpGetPaintMode**

11 **Name**

12 `opvpGetPaintMode` – Gets the background color painting mode of a Graphics State Object.

13 **Synopsis**

```
14     opvp_result_t opvpGetPaintMode(  
15         opvp_dc_t printerContext,  
16         opvp_paintmode_t *ppaintmode);
```

17 **Arguments**

18 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

19 ppaintmode – Pointer to the painting mode enumeration value to be returned.

20 **Description**

21 This function gets the background color painting mode of a Graphics State Object.

22 The initial painting mode of a Graphics State Object is driver dependent.

23 **Return Value**

24 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

25 **4.5.30.opvpSetStrokeColor**

26 **Name**

27 `opvpSetStrokeColor` – Sets the stroke color and pattern for the `opvpStrokePath()` and `opvpStrokeFillPath()`
28 operations of a Graphics State Object.

29 **Synopsis**

```
30     opvp_result_t opvpSetStrokeColor(  
31         opvp_dc_t printerContext,  
32         const opvp_brush_t *brush);
```

33 **Arguments**

34 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

35 brush – Pointer to the `opvp_brush_t` structure data.

36 **Description**

37 This function sets the color or pattern to be used by the Graphics State Object when drawing strokes as instructed by the
38 `opvpStrokePath()` and `opvpStrokeFillPath()` operations.

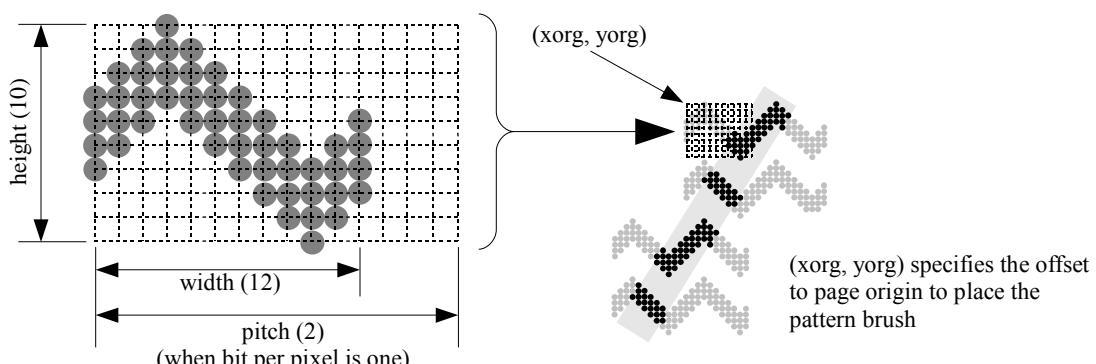

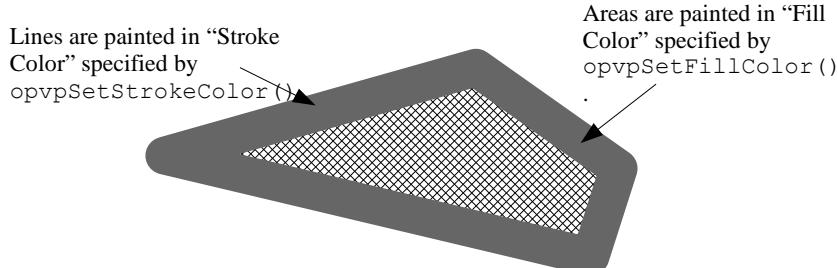

39 If the `pbrush` member of the `*brush opvp_brush_t` structure is NULL, the driver MUST treat it as a solid brush. In this
40 case, the brush's color value is specified in the `color[]` array of the `*brush opvp_brush_t` structure. The `color[]`
41 array is interpreted according to the brush's `colorSpace`.

42 If the `pbrush` member of the `*brush opvp_brush_t` structure points to a `opvp_brushdata_t` structure, the driver
43 MUST treat it as a pattern brush. The `opvp_brushdata_t` structure's `width` and `height` members are specified in pixels,

1 and the brush pattern's horizontal repetition *pitch* is specified as a number of bytes. The actual pattern data is specified in the
2 *data* array. The pattern is interpreted according to the brush's *colorSpace*, and the *color*[] array MUST be ignored.

3 The *type* member of the *opvp_brushdata_t* structure is intended for future extensions. To maintain compatibility
4 between the current and future versions of the specification, the caller MUST set this member to *OPVP_BDTYPE_NORMAL* for
5 the current version of this specification.

6 The initial stroke color of a Graphics State Object is driver dependent.

Structures

```
27 typedef struct _opvp_brushdata {  
28     opvp_bdtype_t type;  
29     opvp_int_t width, height, pitch;  
30     opvp_byte_t data[];  
31 } opvp_brushdata_t;  
32  
33 typedef struct _opvp_brush {  
34     opvp_cspace_t colorSpace;  
35     opvp_int_t color[4];  
36     opvp_int_t xorg, yorg;  
37     opvp_brushdata_t *pbrush;  
38 } opvp_brush_t;  
39  
40  
41     typedef enum _opvp_bdtype {OPVP_BDTYPE_NORMAL = 0} opvp_bdtype_t;
```

Return Value

42 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in *opvpErrorNo*.

4.5.31.*opvpSetFillColor*

Name

45 *opvpSetFillColor* – Sets the fill color and pattern for the *opvpFillPath()* and *opvpStrokeFillPath()* operations of a
46 Graphics State Object.

Synopsis

47 *opvp_result_t opvpSetFillColor(*

```
1     opvp_dc_t printerContext,  
2     const opvp_brush_t *brush);
```

Arguments

printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

brush – Pointer to brush structure data.

Description

This function registers the color or pattern to be used by the Graphics State Object when filling areas as instructed by the `opvpFillPath()` and `opvpStrokeFillPath()` operations.

The definition and behavior of the `opvp_brush_t` structure `*brush` is identical to that specified for the `opvpSetStrokeColor()` function.

The initial fill color of a Graphics State Object is driver dependent.

Return Value

`OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

4.5.32.opvpSetBgColor

Name

`opvpSetBgColor` – Sets the background color for the `opvpStrokePath()`, `opvpFillPath()` and `opvpStrokeFillPath()` operations of a Graphics State Object.

Synopsis

```
19     opvp_result_t opvpSetBgColor(  
20         opvp_dc_t printerContext,  
21         const opvp_brush_t *brush);
```

Arguments

printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

brush – Pointer to brush structure data.

Description

This function sets the background color for the `opvpStrokePath()`, `opvpFillPath()` and `opvpStrokeFillPath()` operations.

The caller MUST set a solid brush via the `*brush` parameter. This is achieved by setting the `pbrush` member of the `opvp_brush_t` structure to `NULL`. If the caller fails to do so, the driver MUST return an error and set the detailed error code to `OPVP_BADREQUEST`.

The driver MAY refer only to the `colorSpace` and `color[4]` members of the `opvp_brush_t` structure, and MUST ignore the `xorg`, `yorg` and `pbrush` members.

The initial background color of a Graphics State Object is driver dependent.

Return Value

`OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

1 4.6.Path Operations

2 This sections defines functions for path operations.

3 A path is used for drawing commands such as “stroke”, “fill” and “stroke and fill”, as well as for defining a clipping area. Any
4 printer context maintains only one path at any one time, and all Graphics State Objects managed by a printer context share the
5 same path. Paths are specified in the caller's coordinate system when passed to path operation functions. The driver transforms
6 the given path to the printer's coordinate system by means of the CTM. The resulting path is registered with the printer context.

7 Driver support for any of the path operation functions is OPTIONAL.

8 4.6.1.opvpNewPath

9 Name

10 opvpNewPath – Starts a new path.

11 Synopsis

```
12    opvp_result_t opvpNewPath(  
13         opvp_dc_t printerContext);
```

14 Arguments

15 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

16 Description

17 This function deletes the printer context's current path and starts a new path. The new path MUST be empty.

18 The initial path of a printer context MUST be empty.

19 Return Value

20 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

21 4.6.2.opvpEndPath

22 Name

23 opvpEndPath – Declares the end of the current path.

24 Synopsis

```
25    opvp_result_t opvpEndPath(  
26         opvp_dc_t printerContext);
```

27 Arguments

28 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

29 Description

30 This function declares the end of the printer context's current path.

31 The printer context MUST retain the path as the current path.

32 Return Value

33 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

34 4.6.3.opvpStrokePath

35 Name

36 opvpStrokePath – Draws lines along the current path.

37 Synopsis

```
38    opvp_result_t opvpStrokePath(  
39         opvp_dc_t printerContext);
```

1 **Arguments**

2 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

3 **Description**

4 This function draws lines along the current path according to the drawing attributes registered with the Graphics State Object.

5 The current path MUST be retained in the printer context after calling this function.

6 **Return Value**

7 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

8 **4.6.4.opvpFillPath**

9 **Name**

10 `opvpFillPath` – Fills the interior of the current path.

11 **Synopsis**

```
12   opvp_result_t opvpFillPath(  
13       opvp_dc_t printerContext);
```

14 **Arguments**

15 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

16 **Description**

17 This function fills the interior of the current path according to the drawing attributes registered with the Graphics State Object.

18 When the path is not closed, the starting point and end point of the current path are connected by a straight line to determine the
19 interior of the path.

20 The current path MUST be retained in the printer context after calling this function.

21 **Return Value**

22 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

23 **4.6.5.opvpStrokeFillPath**

24 **Name**

25 `opvpStrokeFillPath` – Draws lines along the current path and fills the interior of the current path.

26 **Synopsis**

```
27   opvp_result_t opvpStrokeFillPath(  
28       opvp_dc_t printerContext);
```

29 **Arguments**

30 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

31 **Description**

32 This function draws lines along the current path, and fills the interior of the current path according to the drawing attributes
33 registered with the Graphics State Object.

34 When the path is not closed, the starting point and end point of the current path are connected by a straight line. This line is
35 used solely to determine the interior of the path and not stroked.

36 The current path MUST be retained in the printer context after calling this function.

37 **Return Value**

38 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

1 **4.6.6.opvpSetClipPath**

2 **Name**

3 opvpSetClipPath – Sets the current path as the clipping region.

4 **Synopsis**

```
5   opvp_result_t opvpSetClipPath(  
6        opvp_dc_t printerContext,  
7        opvp_cliprule_t clipRule);
```

8 **Arguments**

9 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

10 clipRule – Clipping rule enumeration value. `OPVP_CLIPRULE_EVENODD` (even-odd rule) and
11 `OPVP_CLIPRULE_WINDING` (non-zero winding number rule) can be set.

12 **Description**

13 This function sets the current path as a clipping region for the Graphics State Object.

14 When the path is not closed, the starting point and end point of the current path are connected by a straight line and closed.

15 The current path MUST be retained in the printer context after calling this function.

16 The clipping region also MUST be retained until the caller invokes one of: `opvpSetClipPath()`,
17 `opvpResetClipPath()`, `opvpRestoreGS()` or `opvpStartPage()`. When the caller calls the `opvpStartPage()`
18 function, the driver MUST reset the clipping region as if the `opvpResetClipPath()` function had been called.

19 **Return Value**

20 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

21 **4.6.7.opvpResetClipPath**

22 **Name**

23 opvpResetClipPath – Resets the clipping region.

24 **Synopsis**

```
25   opvp_result_t opvpResetClipPath(  
26        opvp_dc_t printerContext);
```

27 **Arguments**

28 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

29 **Description**

30 This function resets the clipping region of a Graphics State Object to cover all of the printable area of the media.

31 **Return Value**

32 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

33 **4.6.8.opvpSetCurrentPoint**

34 **Name**

35 opvpSetCurrentPoint – Sets the current point.

36 **Synopsis**

```
37   opvp_result_t opvpSetCurrentPoint(  
38        opvp_dc_t printerContext,  
39        opvp_fix_t x,  
40        opvp_fix_t y);
```

41 **Arguments**

42 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

1 x – value of the x coordinate of the new current point.

2 y – value of the y coordinate of the new current point.

3 **Description**

4 This function set the current point of the printer context to (x, y) .

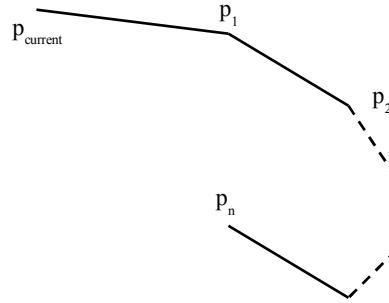

5 **Return Value**

6 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

7 **4.6.9.opvpLinePath**

8 **Name**

9 opvpLinePath – Adds multiple, connected line segments to the current path.

10 **Synopsis**

```
opvp_result_t opvpLinePath(
    opvp_dc_t printerContext,
    opvp_pathmode_t flag;
    opvp_int_t npoints,
    const opvp_point_t *points);
```

16 **Arguments**

17 printerContext – Printer context value returned by the opvpOpenPrinter() function.

18 flag – Path open/close flag. One of OPVP_PATHCLOSE and OPVP_PATHOPEN can be set.

19 npoints – Number of elements in points.

20 points – Pointer to an opvp_point_t structure array.

21 **Description**

22 This function adds the line segments specified by the points array starting at the current point.

23 When the caller passes OPVP_PATHOPEN as flag, the driver MUST append the line segments from the current point and
24 make the last point of the points array the new current point. When the caller passes OPVP_PATHCLOSE as flag, the driver
25 MUST append the line segments from the current point and make the first point of the points array the new current point.

26 **Structures**

```
typedef struct _opvp_point {
    opvp_fix_t x, y;
} opvp_point_t;
```

30 **Return Value**

31 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

32 **4.6.10.opvpPolygonPath**

33 **Name**

34 opvpPolygonPath – Adds polygons to the current path.

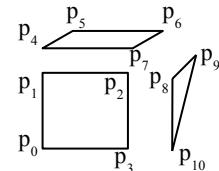

35 **Synopsis**

```
opvp_result_t opvpPolygonPath(
    opvp_dc_t printerContext,
    opvp_int_t npolygons,
    const opvp_int_t *nvertices,
    const opvp_point_t *points);
```

41 **Arguments**

42 printerContext – Printer context value returned by the opvpOpenPrinter() function.

44 npolygons – Number of polygons to add.

For the above case, each of the arguments is as follows:

npolygons=3
*nvertices={4, 4, 3}
*points={p0, p1, ... p10}

1 nvertices – Pointer to an array with the number of points of each polygon.
 2 points – Pointer to an `opvp_point_t` structure array. The number of points in this array MUST be equal to the sum total
 3 of the values in the `nvertices` array.

4 **Description**

5 This function adds the polygons specified via its arguments to the current path.
 6 After the polygons have been added, the driver MUST make the last point of the `points` array the new current point.

7 **Return Value**

8 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

9 **4.6.11.opvpRectanglePath**

10 **Name**
 11 `opvpRectanglePath` – Adds rectangles to the current path.

12 **Synopsis**

```
13 opvp_result_t opvpRectanglePath(  

14     opvp_dc_t printerContext,  

15     opvp_int_t nrectangles,  

16     const opvp_rectangle_t *rectangles);
```

17 **Arguments**

18 `printerContext` – Printer context value returned by the
 19 `opvpOpenPrinter()` function.
 20 `nrectangles` – Number of rectangles to add.
 21 `rectangles` – Pointer to an `opvp_rectangle` structure array.

22 **Description**

23 This function adds rectangles to the current path.
 24 After the rectangles have been appended, the driver MUST make the starting point of the last rectangle appended the new
 25 current point.
 26 The direction of the paths of each rectangle are specified by the starting and diagonal points as illustrated in the figure above.
 27 The path is appended in order $(x0, y0)-(x1, y0)-(x1, y1)-(x0, y1)-(x0, y0)$ where the starting point $p0$ is $(x0, y0)$ and the diagonal
 28 point $p1$ is $(x1, y1)$.

29 **Structures**

```
30 typedef struct _opvp_rectangle {  

31     opvp_point_t p0; /* starting point */  

32     opvp_point_t p1; /* diagonal point */  

33 } opvp_rectangle_t;
```

34 **Return Value**

35 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

36 **4.6.12.opvpRoundRectanglePath**

37 **Name**
 38 `opvpRoundRectanglePath` – Adds rounded rectangles to the current path.

39 **Synopsis**

```
40 opvp_result_t opvpRoundRectanglePath(  

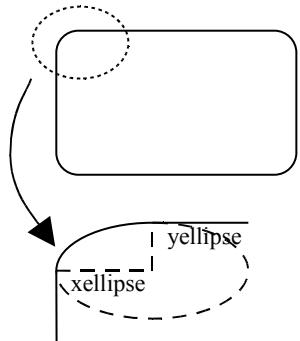

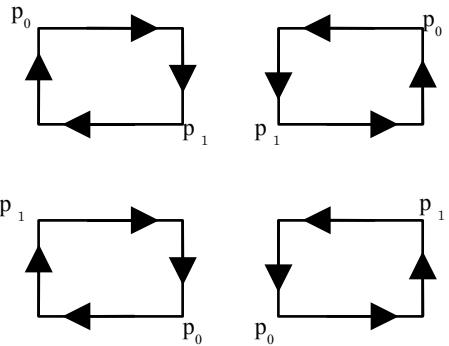

41     opvp_dc_t printerContext,  

42     opvp_int_t nrectangles,  

43     const opvp_roundrectangle_t *rectangles);
```

44 **Arguments**

45 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

1 nrectangles – Number of rounded rectangles to add.
 2 rectangles – Pointer to an `opvp_roundrectangle_t` structure array.

 3 **Description**
 4 This function adds rounded rectangles to the current path.
 5 Each corner of a rounded rectangle is connected by an elliptic arc defined by the values of the `xellipse` and `yellipse`
 6 members of the `opvp_roundrectangle_t` structure. After the rounded rectangles have been appended, the driver MUST
 7 make the starting point of the last rounded rectangle appended the new current point.
 8 The direction of the paths of each rounded rectangle MUST follow the conventions as specified for the
 9 `opvpRectanglePath()` function.

10 **Structures**
 11

```
typedef struct _opvp_roundrectangle {
    12     opvp_point_t p0;                      /* starting point */
    13     opvp_point_t p1;                      /* diagonal point */
    14     opvp_fix_t xellipse, yellipse;
    15 } opvp_roundrectangle_t;
```

16 **Return Value**
 17 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

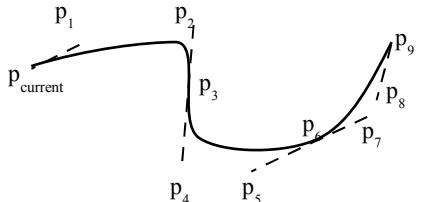

4.6.13.opvpBezierPath

19 **Name**
 20 `opvpBezierPath` – Adds Bézier path segments to the path.

21 **Synopsis**
 22

```
opvp_result_t opvpBezierPath(
    23     opvp_dc_t printerContext,
    24     opvp_int_t npoints,
    25     const opvp_point_t *points);
```

26 **Arguments**
 27 `printerContext` – Printer context value returned by the `opvpOpenPrinter()`
 28 function.
 29 `npoints` – Number of elements in `points`. It MUST be multiple of 3.
 30 `points` – Pointer to the array of end and control points of Bézier curves.

In the above case, each arguments are as following:
`npoints = 9`
`*points = {p1, p2, ... p9}`

31 **Description**
 32 This function adds multiple Bézier path segments to the current path. Each path segment is specified by four points. The
 33 current point is the start point of the segment and the first point in the `points` array is used to define the start tangent vector.
 34 The second point in the `points` array is used to define the end tangent vector and the third point defines the segment's end
 35 point. The segment's end point becomes the path's new current point. The next path segment is constructed in identical fashion
 36 using the next three points in the `points` array. This process repeats until all points of the `points` array have been used.
 37 After the driver has appended the Bézier path segments, the driver MUST set the last point of the `points` array as the current
 38 point.
 39 If `npoints` is not a multiple of 3, this function MUST return an error and set the detailed error code to `OPVP_PARAMERROR`.

40 **Return Value**
 41 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

4.6.14.opvpArcPath

43 **Name**
 44 `opvpArcPath` – Adds arcs, chords, or pies to the current path.

1 **Synopsis**

```
2    opvp_result_t opvpArchPath(
3        opvp_dc_t printerContext,
4        opvp_arcmode_t kind,
5        opvp_arcdir_t dir,
6        opvp_fix_t bby0, opvp_fix_t bby0, opvp_fix_t bby1, opvp_fix_t bby1,
7        opvp_fix_t x0, opvp_fix_t y0,
8        opvp_fix_t x1, opvp_fix_t y1);
```

9 **Arguments**

10 printerContext – Printer context value returned by the `opvpOpenPrinter()` function.

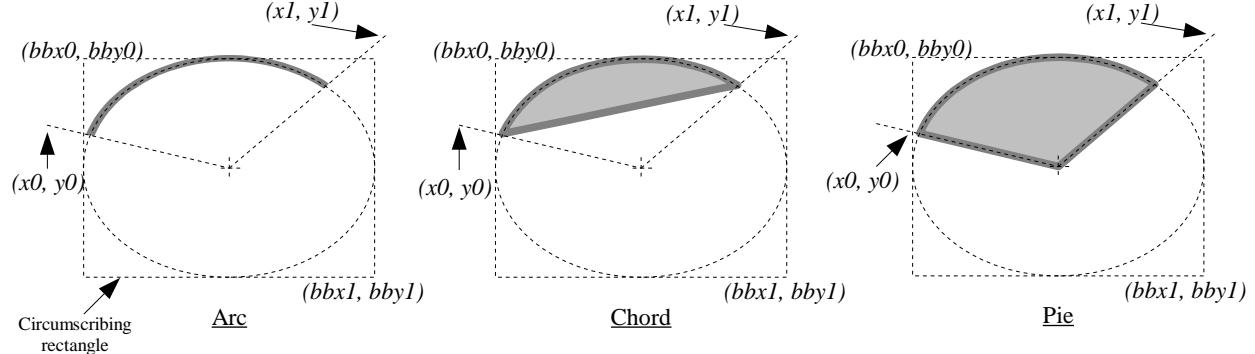

11 kind – Type of arc path. `OPVP_ARC`(Arc), `OPVP_CHORD`(Chord), `OPVP_PIE`(Pie) can be set.

12 dir – Direction of the path. `OPVP_CLOCKWISE`(Clockwise), `OPVP_COUNTERCLOCKWISE`(Counter-clockwise) can be set.

13 `bbx0, bby0, bbx1, bby1` – Circumscribing rectangle.

14 `x0, y0` – Starting point.

15 `x1, y1` – End point.

26 **Description**

27 This function adds an arc, a chord or a pie to the current path. The center point of ellipse is the middle point of the circumscribe
28 rectangle. The direction of the path is specified by `dir`. When `OPVP_ARC` is set into `kind` and the same point is set into both
29 start and end points, driver MUST append ellipse into the path. If the circumscribe rectangle is a square, driver MUST adds
30 circle to the path.

31 After driver adds paths, in case of arc, driver MUST set the end point of the arc as the current point. In case of chord or pie,
32 driver MUST set the left-top point of the circumscribe rectangle as the current point.

33 **Return Value**

34 `OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

35

36

37

1 4.7.Bitmap Image Operations

2 This section defines functions for bitmap operations.

3 A bitmap is a pixel oriented image format for rectangular images. A bitmap is drawn using the drawing attributes registered
4 with a Graphics State Object.

5 The typical bitmap drawing sequence is as follows:

- 6 ● `opvpStartDrawImage()` – Declares the start of a bitmap drawing sequence and sets up the Graphics State
7 Object.
- 8 ● `opvpTransferDrawImage()` – Transfers the actual image data. The caller typically invokes this function
9 one or more times.
- 10 ● `opvpEndDrawImage()` – Declares the end of a bitmap drawing sequence.

11 If the caller calls any functions other than the `opvpTransferDrawImage()` or `opvpAbortJob()` function between the
12 `opvpStartDrawImage()` and `opvpEndDrawImage()` functions, the driver MUST return an error and set the detailed
13 error code to `OPVP_BADREQUEST`.

14 The `opvpDrawImage()` convenience function performs the `opvpStartDrawImage()`, `opvpTransferDrawImage()` and
15 `opvpEndDrawImage()` function calls as a single function call.

16 All bitmap operation functions are OPTIONAL.

17 4.7.1.opvpDrawImage

18 Name

19 `opvpDrawImage` – Draws a bitmap image

20 Synopsis

```
21 opvp_result_t opvpDrawImage(  
22     opvp_dc_t printerContext,  
23     opvp_int_t sourceWidth,  
24     opvp_int_t sourceHeight,  
25     opvp_int_t sourcePitch,  
26     opvp_imageformat_t imageFormat,  
27  
28     opvp_int_t destinationWidth,  
29     opvp_int_t destinationHeight,  
30     const void *imageData);
```

31 Arguments

32 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

33 `sourceWidth` – Width (in pixels) of the source image.

34 `sourceHeight` – Height (in pixels) of the source image.

35 `sourcePitch` – Length (in bytes) of each line of image data.

36 `imageFormat` – Image format of the source image.

37 `destinationWidth` – Destination drawing width (in caller coordinate system units).

38 `destinationHeight` – Destination drawing height (in caller coordinate system units).

39 `imageData` – Pointer to the source image data.

40 Description

41 This function is a convenience function to transfer a bitmap image in a single function call. It is functionally equivalent to the
42 following:

```
43 opvpStartDrawImage (printerContext, sourceWidth, sourceHeight, sourcePitch,  
44     imageFormat, destinationWidth, destinationHeight);  
45 opvpTransferDrawImage(printerContext, sourceHeight * sourcePitch, imageData);  
46 opvpEndDrawImage(printerContext);  
47 See the respective functions for more details.
```

1 **Return Value**

2 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

3 **4.7.2.opvpStartDrawImage**

4 **Name**

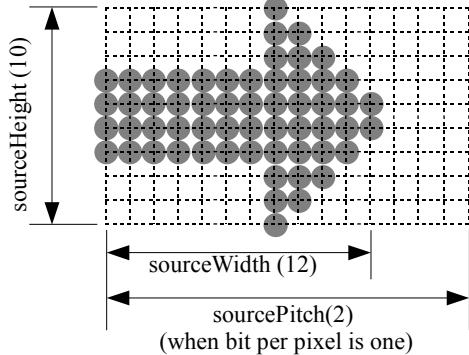

5 opvpStartDrawImage – Declares the start of a bitmap drawing sequence.

6 **Synopsis**

```

7    opvp_result_t opvpStartDrawImage(
8        opvp_dc_t printerContext,
9        opvp_int_t sourceWidth,
10       opvp_int_t sourceHeight,
11       opvp_int_t sourcePitch,
12       opvp_imageformat_t imageFormat,
13      
14       opvp_int_t destinationWidth,
15       opvp_int_t destinationHeight
16   );

```

17 **Arguments**

18 printerContext – Printer context value returned by the
19 opvpOpenPrinter() function.

20 sourceWidth – Width (in pixels) of the source image.

21 sourceHeight – Height (in pixels) of the source image.

22 sourcePitch – Length (in bytes) of each line of image data.

23 imageFormat – Image format of the source image.

24 destinationWidth – Destination drawing width (in caller coordinate system units).

25 destinationHeight – Destination drawing height (in caller coordinate system units).

26 **Description**

27 This function declares the start of a bitmap image drawing operation. The destination image drawing area is specified by means
28 of the current point kept in the printer context and destinationWidth and destinationHeight. The upper-left corner
29 of the image MUST be drawn on the current point and the bottom-right corner of the image MUST be drawn at ($x_{current} +$
30 $destinationWidth - 1, y_{current} + destinationHeight - 1$) where $x_{current}$ is the current point x coordinate value and $y_{current}$ is the current
31 point y coordinate value.

32 If the width or height of source and destination are not equal, the image are expected to be drawn scaled. If the driver does not
33 support image scaling, this function MAY return an error and set the detailed error code to OPVP_NOTSUPPORTED.

34 If the current point coordinate value is not an integer, the reference point for drawing the image MAY be rounded to an integer.

35 After the caller calls this function, the caller MUST call the opvpTransferDrawImage() function once or more to transfer
36 the actual image data to the driver, or call the opvpAbortJob() to abort the printing job. If the caller calls any other function
37 between the opvpStartDrawImage() and opvpEndDrawImage() function, the driver MUST return an error and set the
38 detailed error code to OPVP_BADREQUEST.

39 The following image formats are defined in this document:

Image Format	Description
OPVP_IFORMAT_RAW	Raw image data. The image data format corresponds to that for the current color space. The caller MUST call the opvpSetColorSpace() function before calling this function. The current color space value MUST be one of the color spaces supported by the driver.
OPVP_IFORMAT_MASK	Mask. The image data format corresponds to that of the OPVP_CSPACE_BW color space. When the painting mode is OPVP_PAINTMODE_OPAQUE (opaque mode) a “1” bit in the image data MUST be drawn using the current fill color, and a “0” bit MUST be drawn using the color set by the opvpSetBgColor() function. When the painting mode is OPVP_PAINTMODE_TRANSPARENT (transparent mode), a “1” bit in the image data MUST be drawn using the current fill color, and a “0” bit MUST NOT be drawn.
OPVP_IFORMAT_JPEG	JPEG image format. Reserved for future extension.
OPVP_IFORMAT_PNG	PNG image format. Reserved for future extension.

OPVP_IFORMAT_RLE	RLE format. Reserved for future extension.
------------------	--

40
 41 The image data format for each color space is defined in the section “Image Data Format”.
 42 A driver MUST support both OPVP_IFORMAT_RAW and OPVP_IFORMAT_MASK.
 43
 44 After drawing an image, the driver MUST NOT change the current point.

45 **Return Value**
 46 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

47 4.7.3.opvpTransferDrawImage

48 **Name**
 49 opvpTransferDrawImage – Transfers a chunk of bitmap image data

50 **Synopsis**
 51

```
opvp_result_t opvpTransferDrawImage(
  52     opvp_dc_t printerContext,
  53     opvp_int_t count,
  54     const void *imageData);
```

55 **Arguments**
 56 printerContext – Printer context value returned by the opvpOpenPrinter() function.
 57 count – Number of image bytes to transfer.
 58 imageData – Pointer to the source image data.

59 **Description**
 60 This function transfers a chunk of bitmap image data. A caller MUST call the opvpStartDrawImage() function before
 61 calling this function.
 62 When this function returns an error, the caller MUST call the opvpEndDrawImage() function before calling any other
 63 function.

64 **Return Value**
 65 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

66 4.7.4.opvpEndDrawImage

67 **Name**
 68 opvpEndDrawImage – Declares the end of a bitmap drawing sequence

69 **Synopsis**
 70

```
opvp_result_t opvpEndDrawImage(
  71     opvp_dc_t printerContext);
```

72 **Arguments**
 73 printerContext – Printer context value returned by the opvpOpenPrinter() function.

74 **Description**
 75 This function declares the end of a bitmap drawing sequence.
 76 If a caller does not transfer a sufficient image data by calling the opvpTransferDrawImage() function, this function MAY
 77 return an error. In this case, the driver MUST set the detailed error code to OPVP_BADREQUEST.

78 **Return Value**
 79 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

1 4.8. Scan Line Operations

2 This section defines functions for scan line operations.

3 Scan line operations provide support for drawing of horizontal lines defined by one or more pairs of begin and end points. Scan
4 lines are drawn with the drawing attributes registered with a Graphics State Object. Specifically, scan lines are drawn using the
5 current fill color.

6 Driver support for any of the scan line operations is OPTIONAL.

7 If the caller calls any API entry other than `opvpScanline()` or `opvpAbortJob()` between the
8 `opvpStartScanline()` and `opvpEndScanline()` functions, the driver MUST return an error and set the detailed error
9 code to `OPVP_BADREQUEST`.

10

11

12 4.8.1. opvpStartScanline

13 **Name**

14 `opvpStartScanline` – Declares the start of a scan line draw operation.

15 **Synopsis**

```
16    opvp_result_t opvpStartScanline(  
17        opvp_dc_t printerContext,  
18        opvp_int_t yposition);
```

19 **Arguments**

20 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

21 `yposition` – Vertical position to draw the scan line.

22 **Description**

23 This function declares the start of a scan line draw operation. Scan lines are drawn using three functions. The
24 `opvpStartScanline()` function declares the start of a scan line draw operation, the `opvpScanline()` function transfers
25 the actual scan line data, and the `opvpEndScanline()` function terminates the scan line draw operation. The driver MUST
26 NOT change the current point after these operations.

27 **Return Value**

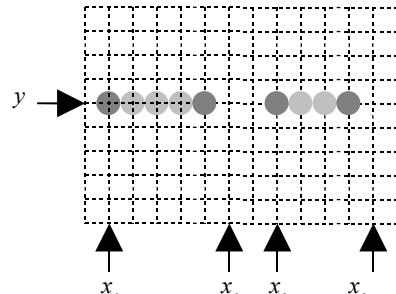

28 `OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

29 4.8.2. opvpScanline

30 **Name**

31 `opvpScanline` – Draws the scan lines.

● scan line begin/end pixels
○ intermediate pixels

32 **Synopsis**

```
33    opvp_result_t opvpScanline(  
34        opvp_dc_t printerContext,  
35        opvp_int_t nscnpairs,  
36        const opvp_int_t *scnpairs);
```

37 **Arguments**

38 `printerContext` – Printer context value returned by the `opvpOpenPrinter()`
39 function.

40 `nscnpairs` – Number of begin and end point pairs

41 `scnpairs` – Pointer to an array of begin and end point pairs

*scnpairs = {{x0, x1}, {x2, x3}}

42 **Description**

43 This function draws the scan lines. After the caller calls this function, the driver MUST increment the y coordinate value of the
44 current scan line by 1. The y coordinate of the current scan line is independent from y coordinate of the current point. The driver

1 MUST maintain the current scan line's y coordinate in the printer context between calls to the `opvpStartScanLine()` and
2 `opvpEndScanLine()` functions. The driver MUST NOT change the current point when this function is called.

3

4 **Return Value**

5 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

6 **4.8.3.opvpEndScanline**

7 **Name**

8 `opvpEndScanline` – Terminates a scan line draw operation.

9 **Synopsis**

```
10    opvp_result_t opvpEndScanline(  
11         opvp_dc_t printerContext);
```

12 **Arguments**

13 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

14 **Description**

15 This function terminates a scan line draw operation.

16 **Return Value**

17 `OPVP_OK` or -1 in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

1 4.9.Raster Image Operations

2 This section defines functions for raster image operations.
3 Raster image operations provide the support for raster image drawing. Driver support for any of the raster image operations is
4 OPTIONAL. However, in case the driver supports neither bitmap image nor path operations, raster image operations MUST be
5 supported.
6 Compressed raster data is not supported by this specification. However, a driver MAY perform raster image data compression if
7 desirable.
8 If the caller calls any API entry other than `opvpTransferRasterData()`, `opvpSkipRaster()` or
9 `opvpAbortJob()` between the `opvpStartRaster()` and `opvpEndRaster()` functions, the driver MUST return an
10 error and set the detailed error code to `OPVP_BADREQUEST`.

11 4.9.1.opvpStartRaster

12 **Name**

13 `opvpStartRaster` – Declares the start of a raster image drawing operation.

14 **Synopsis**

```
15    opvp_result_t opvpStartRaster(  
16         opvp_dc_t printerContext,  
17         opvp_int_t rasterWidth);
```

18 **Arguments**

19 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

20 `rasterWidth` – Width (in pixels) of the raster image (MUST NOT include padding data)

21 **Description**

22 This function declares the start of a raster data drawing operation.

23 The driver MUST draw the raster image starting at the current point.

24 The driver MUST use the color space registered with the current Graphics State Object when interpreting the raster image data.

25 Raster data color spaces and their corresponding formats are defined in the section “Image Data Format”.

26 **Return Value**

27 `OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

28 4.9.2.opvpTransferRasterData

29 **Name**

30 `opvpTransferRasterData` – Transfers raster image data.

31 **Synopsis**

```
32    opvp_result_t opvpTransferRasterData(  
33         opvp_dc_t printerContext,  
34         opvp_int_t count,  
35         const opvp_byte_t *data);
```

36 **Arguments**

37 `printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

38 `count` – Number of pixel data elements.

39 `data` – Pointer to pixel data array.

40 **Description**

41 This function transfers pixel data elements of a single row of raster data. The driver MUST only transfer the lesser of `count`
42 and `rasterWidth` pixels. If `count` is less than `rasterWidth`, the driver MUST NOT transfer “filler” pixels. In case
43 `count` exceeds `rasterWidth`, the driver MUST ignore the additional pixels.

1 After drawing the raster data, the driver MUST increment the value of the *y* coordinate of the current point by 1.

2 **Return Value**

3 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

4 4.9.3.opvpSkipRaster

5 **Name**

6 opvpSkipRaster – Skips lines during raster image drawing.

7 **Synopsis**

```
8     opvp_result_t opvpSkipRaster(  
9         opvp_dc_t printerContext,  
10        opvp_int_t count);
```

11 **Arguments**

12 printerContext – Printer context value returned by the opvpOpenPrinter() function.

13 count – Number of lines to be skipped.

14 **Description**

15 This function skips count lines in the vertical direction during raster image drawing. After skipping these lines, the driver
16 MUST increment the value of the *y* coordinate of the current point by count.

17 **Return Value**

18 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

19 4.9.4.opvpEndRaster

20 **Name**

21 opvpEndRaster – Terminates a raster image draw operation.

22 **Synopsis**

```
23     opvp_result_t opvpEndRaster(  
24         opvp_dc_t printerContext);
```

25 **Arguments**

26 printerContext – Printer context value returned by the opvpOpenPrinter() function.

27 **Description**

28 This function terminates a raster image draw operation.

29 **Return Value**

30 OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.

4.10.Stream Data Operations

This section defines functions for stream data operations.

Stream data operations provide support for applications that create printer native PDL(Printer Description Language) data and sends this data to the device directly. Driver support for any of the stream data operations is OPTIONAL

If the caller calls any API entries other than `opvpTransferStreamData()` or `opvpAbortJob()` between the `opvpStartStream()` and `opvpEndStream()` functions, the driver MUST return an error and set the detailed error code to `OPVP_BADREQUEST`.

4.10.1.opvpStartStream

Name

`opvpStartStream` – Declares the start of a stream data transfer.

Synopsis

```
opvp_result_t opvpStartStream(  
    opvp_dc_t printerContext);
```

Arguments

`printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

Description

This function declares the start of a stream data transfer. Stream data is data that is sent to the printer device directly without any processing by the driver.

Return Value

`OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

4.10.2.opvpTransferStreamData

Name

`opvpTransferStreamData` – Sends stream data.

Synopsis

```
opvp_result_t opvpTransferStreamData(  
    opvp_dc_t printerContext,  
    opvp_int_t count,  
    const void *data);
```

Arguments

`printerContext` – Printer context value returned by the `opvpOpenPrinter()` function.

`count` – Number of data bytes to transfer.

`data` – Pointer to the stream data.

Description

This function sends stream data directly to the printer device.

Return Value

`OPVP_OK` or `-1` in case of error. In the latter case, the driver MUST store the detailed error code in `opvpErrorNo`.

4.10.3.opvpEndStream

Name

`opvpEndStream` – Declares the end of a stream data transfer.

```
1 Synopsis
2     opvp_result_t opvpEndStream(
3         opvp_dc_t printerContext);
4 Arguments
5     printerContext – Printer context value returned by the opvpOpenPrinter() function.
6 Description
7     This function terminates a stream data transfer.
8 Return Value
9     OPVP_OK or -1 in case of error. In the latter case, the driver MUST store the detailed error code in opvpErrorNo.
```

5.Macros, Types, Enumerations and Structures

1 5.1.Return Values

```
2 #define OPVP_OK           0      /* -1 for errors */
```

1 5.2.Error Codes

```
2 #define OPVP_FATALERROR   -1      /* error: cannot be recovered */
3 #define OPVP_BADREQUEST    -2      /* error: called where it should not be called */
4 #define OPVP_BADCONTEXT     -3      /* error: invalid printer context */
5 #define OPVP_NOTSUPPORTED   -4      /* error: combination of parameters are set */
6                                /* that cannot be handled by driver or printer */
7 #define OPVP_JOBCANCELLED   -5      /* error: job has been canceled by some cause */
8 #define OPVP_PARAMERROR     -6      /* error: invalid parameter */
9 #define OPVP_VERSIONERROR    -7      /* error: invalid API version */
```

1 5.3.Basic Types

```
2 typedef int opvp_dc_t;                  /* driver/device context */
3 typedef int opvp_result_t;              /* return value */
4 typedef unsigned char opvp_byte_t;      /* BYTE */
5 typedef unsigned char opvp_char_t;       /* character (string) */
6 typedef int opvp_int_t;                 /* integer */
7 typedef int opvp_fix_t;                 /* fixed integer */
8 typedef float opvp_float_t;             /* float */
9 typedef unsigned int opvp_flag_t;        /* flags */

10 typedef struct _opvp_point {
11     opvp_fix_t x, y;
12 } opvp_point_t;

7. History

- 1
- 2 Version 0.1 (Japanese) Mihara/Toratani
- 3 Version 0.2 (Japanese) Mihara
 - 4 openprinting-0.1.1 implementation by opfc
- 5 Version 0.2-en 2004-3-14 Mihara/Toratani/Kitayama/Yamagishi/Kanjo
 - 6 Translation to English
 - 7 Feedback from opfc implementation
- 8 Version 1.0 RC1 2005-7-20 Mihara
 - 9 Change copyright notice from FDL to MIT style copyright
 - 10 Delete temporary font operations.
- 11 Version 1.0 RC2 2006-6-9/2006-6-17/2006-6-20/2006-6-26/2006-6-29
 - 12 Add API version number to OpenPrinter() parameter
 - 13 Add pitch and delete count to/from DrawImage()/StartDrawImage()
 - 14 Add a figure for SetMiterLimit.
 - 15 Change function names/constants/enumerations/structures names to add FSG prefixes.
 - 16 Change copyright year and dates
 - 17 Delete "Printer Driver Database"
 - 18 Delete *cmap* from CSPASE chart.
 - 19 Fix parameter colorSpace (wrong) to colorDepth (correct) for DrawImage()/StartDrawImage
 - 20 Change description for fsgpdStartJob/fsgpdEndJob/fsgpdAbortJob
 - 21 Add type FSGPD_CHAR for character type
- 22 Version 1.0 RC2 2006-10-20
 - 23 Add FSGPD_CSPACE_DEVICEKRGB
 - 24 Remove "current implementation" descriptions from Color Scheme and Color Space descriptions.
 - 25 Remove "described later" descriptions
 - 26 Make support of updf for scheme "MUST."
- 27 Version 1.0 RC2 2006-12-05
 - 28 Format: Add line numbers and chapter numbers.
 - 29 Format: Replace Microsoft Expressions object to OOo Expressions
- 30 Version 1.0 RC3 2007-5-19 Toratani
 - 31 Append "opvp" or "OPVP" to function names, enumerations, symbols according to the naming rules.
 - 32 Update parameters of opvpOpenPrinter() function and the bitmap image functions.
 - 33 Rearrange the document sections, chapters and text format.
 - 34 Merge the RC2 2006-6-9 – 2006-12-05 updates made by Mihara
- 35
- 36
