

1 Requirements for IPP Notifications  
2  
3  
4

5 STATUS OF THIS MEMO  
6

7 This document is an Internet-Draft. Internet-Drafts are working documents of the Internet Engineering  
8 Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working  
9 documents as Internet-Drafts.

10  
11 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or  
12 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material  
13 or to cite them other than as "work in progress."  
14

15 To learn the current status of any Internet-Draft, please check the "Iid-abstracts.txt" listing contained in  
16 the Internet- Drafts Shadow Directories on ftp.is.co.za (Africa), nic.nordu.net (Europe), munnari.oz.au  
17 (Pacific Rim), ds.internic.net (US East Coast), or ftp.isi.edu (US West Coast).  
18

19 ABSTRACT  
20

21 This document is one of a set of documents which together describe all aspects of a new Internet Printing  
22 Protocol (IPP). IPP is an application level protocol that can be used for distributed printing on the  
23 Internet. There are multiple parts to IPP, but the primary architectural components are the Model, the  
24 Protocol and an interface to Directory Services. This document provides a statement of the requirements  
25 for notifications as part of an IPP Service. The full set of IPP documents include:  
26

27 Requirements for an Internet Printing Protocol  
28 Internet Printing Protocol/1.0: Model and Semantics  
29 Internet Printing Protocol/1.0: Protocol Specification  
30 Rationale for the Structure of the Model and Protocol  
31 for the Internet Printing Protocol  
32

33 **1.0 Scope**

34

35 The scope of this requirements statement is for end users. This document does not address requirements  
36 specific to print administrators or operators. However, we fully expect the notification mechanisms  
37 defined in support of the requirements set forth in this document to be extendible to print administrators  
38 and operators as well.

39

40 **2.0 Terminology**

41

42 It is necessary to define a set of terms in order to be able to clearly express the requirements for  
43 notification services in an IPP System.

44

45 **2.1 Job Submitting End User**

46

47 A human end user who submits a print job to an IPP Printer. This person may or may not be within the  
48 same security domain as the Printer. This person may or may not be geographically near the printer.

49

50 **2.2 Job Submitting Application**

51

52 An application (for example a batch application), acting on behalf of an end user, which submits a print  
53 job to an IPP Printer. The application may or may not be within the same security domain as the Printer.  
54 This application may or may not be geographically near the printer.

55

56 **2.3 Security Domain**

57

58 For the purposes of this discussion, the set of network components which can communicate without going  
59 through a proxy or firewall. A security domain may be geographically very large, for example - anyplace  
60 within IBM.COM.

61

62 **2.4 IPP Client**

63

64 The software component on the client system which implements the IPP protocol.

65

66 **2.5 Job Recipient**

67

68 A human who is the ultimate consumer of the print job. In many cases this will be the same person as the  
69 Job Submitting End User, but this need not always be the case. For example, if I use IPP to print a  
70 document on a printer in a business partner's office, I am the Job Submitting End User, while the person I  
71 intend the document for in my business partner's office is the Job Recipient. Since one of the goals of IPP  
72 is to be able to print near the ultimate recipient of the printed output, we would normally expect the Job  
73 Recipient to be in the same security domain as, and geographically near the Printer. However, this may  
74 not always be the case. For example, I submit a print job across the Internet to a Kinko's print shop. I am  
75 both the Submitting end User and the Job Recipient, but I am neither near nor in the same security  
76 domain as the Printer.

77

78 **2.6 Job Recipient Proxy**

79

80 A person acting on behalf of the Job Recipient. In particular, the Job Recipient Proxy physically picks up  
81 the printed document from the Printer, if the Job Recipient cannot perform that function. The Proxy is **by**  
82 **definition** geographically near and in the same security domain as the printer. For example, I submit a  
83 print job from home to be printed on a printer at work. I'd like my secretary to pick up the print job and  
84 put it on my desk. In this case, I am acting as both Job Submitting End User and Job Recipient. My  
85 secretary is acting as a Job Recipient Proxy.

86

87 **2.7 Notification Recipient**

88

89 Any of: Job Submitting End User, Job Submitting Application, Job Recipient, or Job Recipient Proxy.

90

91 **2.8 Notification Recipient Agent**

92

93 A program which receives events on behalf of the notification recipient. The agent may take some action  
94 on behalf of the recipient, forward the notification to the recipient via some alternative means (for  
95 example, page the recipient), or queue the notification for later retrieval by the recipient.

96

97 **2.9 Notification Events**

98

99 Any of the following constitute events that a Job Submitting End User can specify notifications be sent for:

100

- 101 • Any standard Printer MIB alert (i.e. device alerts)
- 102 • Job Received (transition from Unknown to Pending)
- 103 • Job Started (Transition from Pending to Processing)
- 104 • Page Complete (Page is stacked)
- 105 • Collated Copy Complete (last sheet of collated copy is stacked)
- 106 • Job Complete (transition from Processing or Processing-stopped to Completed)
- 107 • Job aborted (transition from Pending, Pending-held, Processing, or Processing-stopped to Aborted)
- 108 • Job canceled (transition from Pending, Pending-held, Processing, or Processing-held to Canceled)

109

110 **2.10 Notification Registration**

111

112 It should be possible for end users to “Register” for notifications of certain types of events, independent of  
113 Job Submission. An end user may register for

114

- 115 • All Job Traps
- 116 • All Traps (Job and Printer)
- 117 • None (Reserves a slot in some limited stable of “notification hosts”)

118

119 **2.11 Notification Attributes**

120

121 IPP Objects (for example, a print job) from which notification are being sent may have attributes  
122 associated with them. A user may want to have one or more of these associated attributes returned along  
123 with a particular notification. In general, these may include any attribute associated with the object  
124 emitting the notification. Examples include:

125

- 126 number-of-intervening jobs
- 127 job-k-octets
- 128 job-k-octets processed
- 129 job impressions
- 130 job-impressions-interpreted
- 131 job-impressions-completed
- 132 impressionsCompletedCurrentCopy (job MIB)
- 133 sheetCompletedCopyNumber (job MIB)
- 134 sheetsCompletedDocumentNumber (job MIB)
- 135 Copies-requested
- 136 Copy-type
- 137 Output-destination
- 138 Job-state-reasons

139

140

141 **2.12 Immediate Notification**

142  
143 Notifications sent to the notification recipient or the notification recipient's agent in such a way that the  
144 notification arrives immediately , within the limits of common addressing, routing, network congestion  
145 and quality of service.

146  
147 **2.13 Queued Notification**

148  
149 Notifications which are not necessarily sent immediately, but are queued for delivery by some intermediate  
150 network application, or for later retrieval. Email with store and forward is an example of queued  
151 notification.

152  
153 **2.14 Notification over Reliable Transport**

154  
155 Notifications which are delivered by a reliable, sequenced delivery of packets or character stream, with  
156 acknowledgment and retry, such that delivery of the notification is guaranteed within some reasonable  
157 time limits. For example, if the notification recipient has logged off and gone home for the day, an  
158 immediate notification cannot be guaranteed to be delivered, even when sent over a reliable transport,  
159 because there is nothing there to catch it. Guaranteed delivery requires both queued notification and a  
160 reliable transport. If delivery of the notification requires process to process communications, each session  
161 is managed in a reliable manner, assuring fully ordered, end-to-end delivery.

162  
163 **2.15 Notification over Unreliable Transport**

164  
165 Notifications are delivered via the fundamental transport address and routing framework, but no  
166 acknowledgment or retry is required. Process to process communications, if involved, are unconstrained.

167  
168  
169 **2.16 Human Consumable Notification**

170  
171 Notifications which are intended to be consumed by human end users **only**. They contain no machine  
172 readable encodings of the event. Email would be an example of a Human consumable notification.

173  
174 **2.17 Machine Consumable Notification**

175  
176 Notifications which are intended for consumption by a program **only**, such as an IPP Client. Machine  
177 Consumable notifications may not contain human readable information.

178  
179 **2.18 Mixed Notification**

180  
181 A mixed notification may contain both human readable and human readable information.

182  
183 **3.0 Requirements**

- 184  
185 3.1 A Job Submitting End User must be able to specify zero or more notification recipients when  
186 submitting a print job.  
187  
188 3.2 When specifying a notification recipient, a Job Submitting End user must be able to specify one or  
189 more notification events for that notification recipient.  
190  
191 3.3 When specifying a notification recipient, the Job Submitting End User must be able to specify either  
192 immediate or queued notification for that notification recipient. This may be explicit, or implied by  
193 the method of delivery chosen by the Job Submitting End User.  
194

- 195 3.4 When specifying a notification event, a Job Submitting End User must be able to specify that zero or  
196 more notification attributes be sent along with the notification, when that event occurs.  
197
- 198 3.5 Common delivery methods, e.g. email, must be supported.  
199
- 200 3.6 There is no requirement for the IPP Printer receiving the print request to validate the identity of an  
201 event recipient, nor the ability of the system to deliver an event to that recipient as requested (for  
202 example, if the event recipient is not at work today).  
203
- 204 3.7 However, an IPP Printer must validate its ability to deliver an event using the specified delivery  
205 scheme. If it does not support the specified scheme, or the specified scheme is invalid for some  
206 reason, then it should respond to the print request with an error condition.  
207
- 208 3.8 There must be a class of IPP event notifications which can flow through corporate firewalls. However,  
209 an IPP printer need not test to guarantee delivery of the notification through a firewall before  
210 accepting a print job.  
211
- 212 3.9 A mechanism must be provided for delivering a notification to the submitting client when the delivery  
213 of an event notification to a specified Notification Recipient fails.  
214
- 215 3.10 There must be a mechanism for localizing human consumable notifications.  
216

#### 217 **4.0 Scenarios**

- 218
- 219
- 220 4.1 I am sitting in my office and submit a print job to the printer down the hall. I am in the same security  
221 domain as the printer and of course, geographically near. I want to know immediately when my print  
222 job will be completed (or if there is a problem) because the document I am working on is urgent. I  
223 submit the print job with the following attributes:  
224
- 225 • Notification Recipient - me
  - 226 • Notification Events - all
  - 227 • Notification Attributes - job-state-reason
  - 228 • Notification Type - immediate
- 229
- 230 4.2 I am working from home and submit a print job to the same printer as in the previous example.  
231 However, since I am not at work, I cannot physically get the print file or do anything with it. It can  
232 wait until I get to work this afternoon. However, I'd like my secretary to pick up the output and put it  
233 on my desk so it doesn't get lost or mis-filed. I'd also like a queued notification sent to my email so  
234 that when I get to work I can tell if there was a problem with the print job. I submit a print job with  
235 the following attributes:  
236
- 237 • Notification Recipient - my secretary
  - 238 • Notification Events - print complete
  - 239 • Notification Type - immediate
- 240
- 241 • Notification Recipient - me
  - 242 • Notification Events - print complete
  - 243 • Notification Attributes - impressions completed
  - 244 • Notification Type - queued
- 245
- 246 4.3 I am sitting in my office and submit a print job to a client at an engineering firm we work with on a  
247 daily basis. The engineering form is in Belgium. I would like my client to know when the print job is

248 complete, so that she can pick it up from the printer in her building. It is important that she review it  
249 right away and get her comments back to me. I submit the print job with the following attributes:  
250

- 251
- 252 • Notification Recipient - client at engineering firm
  - 253 • Notification Events - print complete
  - 254 • Notification Type - immediate
  - 255 • Notification Language - French
- 256

257 4.4 I am in a hotel room and send a print job to a Kinko's store in the town I am working in, in order to  
258 get a printed report for the meeting I am attending in the morning. Since I'm going out to dinner  
259 after I get this job submitted, an immediate notification won't do me much good. However, I'd like to  
260 check in the morning before I drive to the Kinko's store to see if the file has been printed. An email  
261 notification is sufficient for this purpose. I submit the print job with the following attributes:  
262

- 263
- 264 • Notification Recipient - me
  - 265 • Notification Events - print complete
  - 266 • Notification Type - email
- 267

268 4.5 I am printing a large, complex print file. I want to have some immediate feedback on the progress of  
269 the print job as it prints. I submit the print job with the following attributes:  
270

- 271 • Notification Recipient - me
  - 272 • Notification Type - immediate
  - 273 • Notification Events - all state transitions
  - 274 • Notification Attributes - impression completed
- 275
