

February 5, 2013
Working Draft

The Printer Working Group

IPP Client Use Best Practices

Status: Initial

Abstract: This document enumerates a number of tasks that are commonly performed by a client in the process of interacting with a print service, and explores options for how the Internet Printing Protocol (IPP) may be used to perform those tasks, some of which are preferred and others that are less than optimal.

This document is a PWG Working Draft. For a definition of a "PWG Working Draft", see: <ftp://ftp.pwg.org/pub/pwg/general/pwg-process30.pdf>

This document is available electronically at:

<ftp://ftp.pwg.org/pub/pwg/general/templates/tb-ipp-best-practices-20130205.pdf>

2 This document may be copied and furnished to others, and derivative works that comment
3 on, or otherwise explain it or assist in its implementation may be prepared, copied,
4 published and distributed, in whole or in part, without restriction of any kind, provided that
5 the above copyright notice, this paragraph and the title of the Document as referenced
6 below are included on all such copies and derivative works. However, this document itself
7 may not be modified in any way, such as by removing the copyright notice or references to
8 the IEEE-ISTO and the Printer Working Group, a program of the IEEE-ISTO.

9 Title: *IPP Client Use Best Practices*

10 The IEEE-ISTO and the Printer Working Group DISCLAIM ANY AND ALL WARRANTIES,
11 WHETHER EXPRESS OR IMPLIED INCLUDING (WITHOUT LIMITATION) ANY IMPLIED
12 WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

13 The Printer Working Group, a program of the IEEE-ISTO, reserves the right to make
14 changes to the document without further notice. The document may be updated, replaced
15 or made obsolete by other documents at any time.

16 The IEEE-ISTO takes no position regarding the validity or scope of any intellectual
17 property or other rights that might be claimed to pertain to the implementation or use of the
18 technology described in this document or the extent to which any license under such rights
19 might or might not be available; neither does it represent that it has made any effort to
20 identify any such rights.

21 The IEEE-ISTO invites any interested party to bring to its attention any copyrights, patents,
22 or patent applications, or other proprietary rights which may cover technology that may be
23 required to implement the contents of this document. The IEEE-ISTO and its programs
24 shall not be responsible for identifying patents for which a license may be required by a
25 document and/or IEEE-ISTO Industry Group Standard or for conducting inquiries into the
26 legal validity or scope of those patents that are brought to its attention. Inquiries may be
27 submitted to the IEEE-ISTO by e-mail at: ieee-isto@ieee.org.

28 The Printer Working Group acknowledges that the IEEE-ISTO (acting itself or through its
29 designees) is, and shall at all times, be the sole entity that may authorize the use of
30 certification marks, trademarks, or other special designations to indicate compliance with
31 these materials.

32 Use of this document is wholly voluntary. The existence of this document does not imply
33 that there are no other ways to produce, test, measure, purchase, market, or provide other
34 goods and services related to its scope.

35

36 **About the IEEE-ISTO**

37 The IEEE-ISTO is a not-for-profit corporation offering industry groups an innovative and
38 flexible operational forum and support services. The IEEE-ISTO provides a forum not only
39 to develop standards, but also to facilitate activities that support the implementation and
40 acceptance of standards in the marketplace. The organization is affiliated with the IEEE
41 (<http://www.ieee.org/>) and the IEEE Standards Association (<http://standards.ieee.org/>).

42 For additional information regarding the IEEE-ISTO and its industry programs visit:

43 <http://www.ieee-isto.org>

44 **About the IEEE-ISTO PWG**

45 The Printer Working Group (or PWG) is a Program of the IEEE Industry Standards and
46 Technology Organization (ISTO) with member organizations including printer
47 manufacturers, print server developers, operating system providers, network operating
48 systems providers, network connectivity vendors, and print management application
49 developers. The group is chartered to make printers and the applications and operating
50 systems supporting them work together better. All references to the PWG in this
51 document implicitly mean “The Printer Working Group, a Program of the IEEE ISTO.” In
52 order to meet this objective, the PWG will document the results of their work as open
53 standards that define print related protocols, interfaces, procedures and conventions.
54 Printer manufacturers and vendors of printer related software will benefit from the
55 interoperability provided by voluntary conformance to these standards.

56 In general, a PWG standard is a specification that is stable, well understood, and is
57 technically competent, has multiple, independent and interoperable implementations with
58 substantial operational experience, and enjoys significant public support.

59 For additional information regarding the Printer Working Group visit:

68 About the Internet Printing Protocol Work Group

69 The Internet Printing Protocol (IPP) working group has developed a modern, full-featured
70 network printing protocol, which is now the industry standard. IPP allows a print client to
71 query a printer for its supported capabilities, features, and parameters to allow the
72 selection of an appropriate printer for each print job. IPP also provides job information prior
73 to, during, and at the end of job processing.

74 For additional information regarding IPP visit:

75 <http://www.pwg.org/ipp/>

76 Implementers of this specification are encouraged to join the IPP mailing list in order to
77 participate in any discussions of the specification. Suggested additions, changes, or
78 clarification to this specification, should be sent to the IPP mailing list for consideration.

120 **1. Introduction**

121 The use case descriptions below represent stages or sub-tasks that users perform in the
122 process of using a printer. Each of these below include a textual description as well as a
123 series of workflow options for how it might be implemented using IPP. Each workflow
124 option will be informally labeled according to its perceived quality, using the set of labels
125 {"BAD", "POOR", "GOOD", "BETTER", "BEST"}, that are ordered from least desirable to
126 most desirable.

127 **2. Terminology**

128 **2.1 Conformance Terminology**

129 Capitalized terms, such as MUST, MUST NOT, RECOMMENDED, REQUIRED, SHOULD,
130 SHOULD NOT, MAY, and OPTIONAL, have special meaning relating to conformance as
131 defined in Key words for use in RFCs to Indicate Requirement Levels [RFC2119]. The
132 term CONDITIONALLY REQUIRED is additionally defined for a conformance requirement
133 that applies to a particular capability or feature.

134 **2.2 Other Terminology**

135 *Capitalized Term In Italics*: definition of the term with any references as appropriate.

136 **2.3 Acronyms and Organizations**

137 *IANA*: Internet Assigned Numbers Authority, <http://www.iana.org/>

138 *IETF*: Internet Engineering Task Force, <http://www.ietf.org/>

139 *ISO*: International Organization for Standardization, <http://www.iso.org/>

140 *PWG*: Printer Working Group, <http://www.pwg.org/>

141

142

143 **3. Requirements**

144 **3.1 Rationale**

145 The Internet Printing Protocol/1.1: Implementor's Guide [RFC3196] was ratified in
146 November 2001. Since that time many extensions to IPP have been ratified, and the
147 scope of use of IPP has grown considerably. Given all these extensions to IPP,
148 implementers would benefit from an updated best practices document that covers the use
149 of these extensions, as well as the core of IPP that has remained unchanged, to assist
150 implementers in their efforts to deliver a quality client experience.

151 **3.2 Use Cases**

152 **3.2.1 Developer Implementing New IPP Client Support**

153 Garrett is a developer working on a new client platform that is adding system-level printing
154 support. Many printers support IPP Everywhere [PWG5100.14], so he plans to implement
155 printing support in his client platform using this standard as well. But IPP Everywhere and
156 its related standards don't describe how best to use IPP for the various tasks his software
157 must perform, in order to deliver a quality client user experience. He finds RFC 3196 but
158 its recommendations are insufficient. Using the IPP Use Best Practices document, he is
159 able to avoid some common design pitfalls and quickly deliver a quality IPP client
160 experience.

161 **3.2.2 Developer Implementing New IPP Printer Support**

162 Duncan is a firmware developer at a printer vendor creating a new printer that implements
163 IPP Everywhere. In reading the IPP Client Use Best Practices, he can more easily
164 anticipate how some segment of clients implemented according to these practices are
165 likely to behave, and more rapidly understand how the various operations can be used with
166 one another to achieve certain tasks.

167 **3.3 Out of Scope**

168 The following are considered out of scope for this specification:

- 169 1. Specifications to extend or replace portions of the Internet Printing Protocol itself
- 170 2. Normative requirements regarding user experience

171 **3.4 Design Requirements**

172 The design requirements for this specification are:

- 173 1. Explore tasks performed by client implementations
- 174 2. Enumerate a series of alternatives
- 175 3. Rank those options according to a non-numeric qualitative grading scheme

176 **4. Tasks and Implementation Alternatives**

177 **4.1 Create A Relationship With A Printer**

178 You can't print to a printer if you cannot establish a connection to it. Historically,
179 connecting to a printer to establish a "relationship" with it meant identifying a printer and
180 then creating a persistent local records and resources for that printer relationship with your
181 system's print spooler. This was called a "print queue", and it involved binding drivers to
182 create the relationships needed to communicate at the different levels, and then keeping
183 record of that set of relationships so that it could be re-used at a later time. The set of
184 printers or other devices the user's system might encounter was relatively small and fairly
185 static.

186 More recent re-thinking of this relationship between client and printer has resulted in more
187 "dynamic" relationship creation, where universal drivers can interrogate a device hosting a
188 print service using a standardized protocol solution stack, and using that dynamically
189 ascertain and update print service attributes. In this paradigm, a "persistent" print service
190 record is more like a Web browser bookmark.

191 Both paradigms still require a method of identifying the target devices. That can be done
192 using dynamic service discovery protocols where the services respond to discovery
193 requests, or explicitly by name (host name or raw IPv4/IPv6 address).

194 **4.1.1 Discover And Select A Printer Via A Discovery Protocol**

195 Discovery protocols are used to identify instances of print services or printers by searching
196 the network for service types or device types. This helps the user by making it so that they
197 don't need to do a physical survey of devices' addresses.

198 Regardless of the actual discovery protocol used, the APIs driving the protocols generally
199 can be used in either a synchronous or asynchronous fashion. Unfortunately, many legacy
200 software systems (as well as developers) are accustomed to the synchronous model,
201 which is easily identified by the presence of a "refresh button". The synchronous model is
202 not as user friendly as the asynchronous model, but it is somewhat easier to write
203 programs in a synchronous way than an asynchronous way.

204 **Options**

- 205 • POOR:
 - 206 ○ Perform network discovery with a synchronous API
 - 207 ■ Show progress bar

- 208 ▪ Discovery.Start()
- 209 ▪ sleep(X) where X
- 210 ▪ Discovery.Stop()
- 211 ○ Present the results of the discovery
- 212 ○ "Refresh" button restarts process
- 213 ▪ Why this is bad:
- 214 • list can be stale
- 215 • The results are not "live"
- 216 • "Reset" button is unnecessary and is a crutch
- 217 ○ User selects a printer and presses "Continue" or equivalent
- 218 • BETTER:
- 219 ○ Perform network discovery with an asynchronous API
- 220 ▪ Show List UI widget
- 221 ▪ Discovery.Start() with a callback
- 222 ▪ callback is called when discovery responses (add or remove) are
- 223 received
- 224 ○ User selects a printer and presses "Continue" or equivalent
- 225 ▪ Discovery.Stop()

226 4.1.2 Select A Printer Via User Provided DNS Hostname Or Raw Ipv4 / Ipv6 Address

227 In some cases a discovery protocol is either not adequate or unnecessary. Examples of
228 when this use case is encountered include pre-published names or addresses, and also
229 situations where the target device is not on the local link. (DNS-SD and WS-Discovery are
230 generally used for link-local discovery, though wide-area variants as well as LDAP systems
231 may also be used, but are frequently not for various reasons.)

232 For each of these options below, the assumption is that the client has been given an
233 address string, and should attempt to connect to the host at that address.

234 Options

- 235 • BAD:
- 236 ○ Let each printer model make up its own path, and depend on some other
237 protocol to get the resource path
- 238 ▪ IPP has no defined standard mechanism to enumerate the Printer
239 objects' resource paths
- 240 • POOR:
- 241 ○ IPP Get-Printer-Attributes with printer-uri set to a URI that was manually
242 entered by the user
- 243 ▪ "ipp" URI scheme could be used to encode the hostname and the
244 resource path
- 245 ▪ Having the user enter the URI exposes too many details to the user,
246 including the detail about the fact that IPP is actually being used.
247 Users need not be aware of which print protocol is being used.

- 248 • GOOD:
- 249 ○ IPP Get-Printer-Attributes with printer-uri set to a well-known Printer resource
- 250 path
- 251 ▪ "/ipp/print"
- 252 • BETTER:
- 253 ○ IPP Get-Printer-Attributes with printer-uri set to "/"
- 254 ○ examine the "printer-uri-supported" attribute; use the first URI in the list
- 255 ○ IPP Get-Printer-Attributes with printer-uri set to first URI
- 256 • BEST:
- 257 ○ IPP Get-Services operation
- 258 ▪ Coming with System Control Service
- 259 ▪ Is this really going to be better?
- 260 • Yes, expected to have metadata associated with each URI
- 261 specifying the class of service

262 4.2 Validate User Access to Printer

263 Selecting a printer is misleading to the user if the user isn't allowed to use the selected
264 printer. Therefore, access restrictions should be validated before selection confirmation
265 (queue creation, etc.) is done on the client system.

266 Options

- 267 • BAD:
- 268 ○ Do Nothing
- 269 ▪ The user may choose a printer but not be able to use it due to not
- 270 having access credentials (username or password or whatever) to use
- 271 that printer
- 272 • GOOD:
- 273 ○ IPP Validate-Job operation
- 274 ▪ Use the defaults, but provide the credentials to allow the user access
- 275 to be determined

276 4.3 Get Printer Options

277 Once a printer has been identified, it is necessary for the print system to understand the
278 capabilities that the printer device's print service provides. This includes what print job
279 payload formats can be consumed by the print service, the available options and default
280 choices, and so forth. It also includes other information about the device itself, such as its
281 location. Some of this is done at relationship creation time (queue creation time), perhaps
282 by consulting information stored statically in the printer. It may be that this information can
283 all be retrieved from the printer itself. This is basically the print dialog's activity between
284 the time that the user performs an action to request that the print dialog be presented, and

285 the time that the dialog is presented to the user, populated with the available option
286 choices.

287 Options

- 288 • SAD:
 - 289 ○ Depend on a-priori knowledge about a particular model as a way of listing
 - 290 options for the model of device identified as the target
 - 291 ▪ Model specific print drivers fall in this bucket
- 292 • GOOD:
 - 293 ○ IPP Get-Printer-Attributes Operation
 - 294 ▪ request includes no printer attributes; only operation attributes
 - 295 ▪ reply will contain the job template attributes for all PDLs
 - 296 ○ Client guesses at what attributes may work or not work for a given PDL, or
 - 297 uses a-priori knowledge
- 298 • BETTER:
 - 299 ○ IPP Get-Printer-Attributes Operation
 - 300 ▪ any specific attributes?
 - 301 ○ Process results; decide on a PDL
 - 302 ○ IPP Get-Printer-Attributes Operation
 - 303 ▪ request includes the document-format attribute with value specifying
 - 304 the chosen PDL
 - 305 ▪ reply will contain the job template attributes appropriately filtered
 - 306 ("colored") for that particular document-format

307 4.4 Check constraints between presented options

308 Printer features and options are presented typically in a print dialog. Some of these have
309 states that have relationships with other options' states, where one cannot be in a
310 particular state if another one is too. These are known as constraints, and they must be
311 calculated any time the state of a control changes state. There are various ways that this
312 can be done.

313 Options

- 314 • POOR:
 - 315 ○ IPP Validate-Job
 - 316 ▪ Every time a control is changed, the client sends IPP Validate-Job
 - 317 with attribute values corresponding to current state of controls
- 318 • GOOD:
 - 319 ○ IPP Validate-Job
 - 320 ▪ when "Print" button is pressed, confirms the job creation / submission
 - 321 will succeed (authentication, etc.)

- 322 ▪ client depends on this operation to perform constraints validation
- 323 printer-side
- 324 • BETTER:
- 325 ○ IPP Get-Printer-Attributes
- 326 ▪ device implements job-constraints-supported
- 327 ▪ device implements job-resolvers-supported
- 328 ○ <Local processing of constraints>
- 329 ○ IPP Validate-Job
- 330 ▪ when "Print" button is pressed, confirms the job creation / submission
- 331 will succeed (authentication, etc.)
- 332 ▪ constraints validation already handled client-side

333 4.5 Submitting a Print Job

334 Once the user has decided on options, the print job is generated and ultimately made
335 available to the printer in some fashion. There are several different ways that this may
336 occur.

337 4.5.1 Submitting a print job "by value"

338 This is the classical way that a print job is sent from the client to the print service: a job is
339 created; and the job information and payload content are sent by the client to the print
340 service.

341 Options

- 342 • POOR:
- 343 ○ IPP Print-Job
- 344 ▪ no pre-flight checks
- 345 ▪ the printer may reject it but only after it has been transmitted in whole
- 346 or in part.
- 347 ▪ better to check ticket and content types first.
- 348 • GOOD:
- 349 ○ IPP Validate-Job
- 350 ▪ pre-flight checks the job by validating the job attributes and document
- 351 type
- 352 ○ IPP Print-Job
- 353 ▪ creates the job and sends the payload in one operation
- 354 ▪ however, the Job object's URI isn't usually known until the job
- 355 transmission is complete
- 356 ▪ doesn't work well with flow-controlled (low-end) printers
- 357 • BETTER:
- 358 ○ IPP Validate-Job
- 359 ▪ pre-flight checks the job by validating the job attributes and document
- 360 type
- 361 ○ IPP Create-Job

- 362 ▪ returns immediately with the job URI for monitoring and ticket
- 363 processing status
- 364 ▪ if there is a problem then Create-Job may fail the same as Validate-
- 365 Job would, but may not, which is why we do a Validate-Job first (so
- 366 that there isn't a zombie job there)
- 367 ○ IPP Send-Document
- 368 ▪ payload transmission is de-coupled from the creation of the job
- 369 ▪ multiple documents can be sent to build up a compound job
- 370 ▪ means that the client doesn't have to be prepared for an early HTTP
- 371 response
- 372 ▪ allows the job URI to be learned before job payload is sent
- 373 ▪ client MUST check to see if value of "multiple-document-jobs-
- 374 supported" is "true", to see if it is OK to do multiple Send-Document
- 375 operations to the same Job object.

376 4.5.2 Submitting a print job "by reference"

377 This is a slightly different way that a print job is sent from the client to the print service: a
378 job is created and made available for retrieval by the print service, and when the print job
379 the job information and job payload content are sent by the client to the print service.

380 Options

- 381 • POOR:
- 382 ○ IPP Print-URI
- 383 ▪ no pre-flight checks
- 384 ▪ the printer may reject it but only after it has been transmitted in whole
- 385 or in part.
- 386 ▪ better to check ticket and content types first.
- 387 • GOOD:
- 388 ○ IPP Validate-Job
- 389 ▪ pre-flight checks the job by validating the job attributes and document
- 390 type
- 391 ○ IPP Print-URI
- 392 ▪ creates the job and sends a URL to where the payload can be
- 393 retrieved in one operation
- 394 ▪ print service retrieves the payload file itself
- 395 ▪ however, the Job object's URI isn't usually known until the job
- 396 transmission is complete
- 397 ▪ doesn't work well with flow-controlled (low-end) printers
- 398 • BETTER:
- 399 ○ IPP Validate-Job
- 400 ▪ pre-flight checks the job by validating the job attributes and document
- 401 type
- 402 ○ IPP Create-Job

- 403 ▪ returns immediately with the job URI for monitoring and ticket
- 404 processing status
- 405 ▪ if there is a problem then Create-Job will fail the same as Validate-Job
- 406 would
- 407 ○ IPP Send-URI
- 408 ▪ payload URI transmission is de-coupled from the creation of the job
- 409 ▪ means that the client doesn't have to be prepared for an early HTTP
- 410 response
- 411 ▪ allows the job URI to be learned before job payload is sent

412 **4.6 Monitoring print job status**

413 While the print job is being processed, users may wish to know whether it is proceeding
414 successfully, or whether there are conditions that they need to handle that are preventing
415 processing from proceeding, such as a media jam, open covers, marking agents depleted,
416 and so forth.

417 **Options**

- 418 • POOR:
 - 419 ○ IPP Get-Printer-Attributes
 - 420 ▪ monitor the value of the printer-state attribute
 - 421 ▪ polling (lame)
- 422 • GOOD:
 - 423 ○ IPP Get-Job-Attributes
 - 424 ▪ targets the specific job status
 - 425 ▪ may be more precise
 - 426 ▪ (need to see if job attributes will show printer issues (top cover open,
 - 427 etc.) that block a job as well)
 - 428 ▪ polling (lame)
- 429 • BETTER:
 - 430 ○ IPP Create-Job-Subscriptions
 - 431 ▪ asynchronous / long running queries for notifications that don't require
 - 432 polling

433 **4.7 Canceling a Print Job**

434 It may be that the user wants to terminate a job before it has been fully processed, for
435 whatever reason. There are things that must be done to ensure that the client has
436 decisively cleaned up the state of the Job Object if the client is responsible for canceling
437 the job. Clients' leaving broken Job objects on the Print service is bad behavior.

438 There is also a dependency between the options below and how the job was submitted. If
439 Print-Job is used, but the document payload is not completely transmitted, then is a Job
440 object even created? (Is this true in all cases? It is - provide a cross-reference.) Also, if

441 Create-Job / Send-Document is used and the Cancel-Job is sent during the Send-
442 Document operation submission, then the job object would still need to be cleaned up by
443 the client that created the Job Object. (Is this true? Provide a cross reference.)

444 Options

- 445 • BAD:
 - 446 ○ Client stop sending data and close the connection
 - 447 ▪ *Problem:* The IPP Job Object may have been created and still exist,
 - 448 and be in an indeterminate state. It should be explicitly cleaned up by
 - 449 the client for best performance and correctness.
 - 450 ▪ *Question:* Are there any realistic or theoretical conditions under which
 - 451 a Print-Job operation does NOT create a Job object?
- 452 • POOR:
 - 453 ○ Client stops sending chunks but doesn't close the connection because it is
 - 454 expecting an IPP operation reply.
 - 455 ○ IPP Cancel-Job operation request for the job via a second connection, which
 - 456 for some printers could result in a PDL interpreter hang because the last
 - 457 chunk sent didn't stop on a "statement" boundary
 - 458 ▪ But if the client stops with a zero length chunk then the IPP stack will
 - 459 know that transport is complete
 - 460 ▪ Need to define a "magic chunk" that operates kind of like an in-band
 - 461 inline Cancel-Job operation, to tell the PDL interpreter that no more
 - 462 job payload chunks?
- 463 • GOOD:
 - 464 ○ IPP Cancel-Job
 - 465 ○ Client stops sending chunks and closes the connection
- 466 • BETTER:
 - 467 ○ ???

468 4.8 Getting printer supplies status

469 Some administrative tasks, like checking consumables levels, are presented to end users
470 in some cases, such as during print job status or in print dialogs. This is useful to end
471 users and should be supported.

472 Options

- 473 • POOR:
 - 474 ○ Don't use IPP but use some proprietary protocol or platform-specific
 - 475 extension to IPP
 - 476 ▪ The point is to use only IPP extensions based on open standards (i.e.
 - 477 PWG standard) and this violates that core principle
- 478 • GOOD:

- 479 ○ IPP Get-Printer-Attributes
- 480 ▪ printer must implement JPS3 "printer-supply" attribute

481

482 **5. Conformance Requirements**

483 TBD.

484 **6. Internationalization Considerations**

485 For interoperability and basic support for multiple languages, conforming implementations
486 MUST support the Universal Character Set (UCS) Transformation Format -- 8 bit (UTF-8)
487 [RFC3629] encoding of Unicode [UNICODE] [ISO10646] and the Unicode Format for
488 Network Interchange [RFC5198].

489 **7. Security Considerations**

490 TBD.

491 **8. IANA Considerations**

492 No IANA registrations were necessary for this document to be authored.

493 **9. References**

494 **9.1 Normative References**

495 [RFC2119] S. Bradner, "Key words for use in RFCs to Indicate Requirement
496 Levels", RFC 2119/BCP 14, March 1997,
497 <http://www.ietf.org/rfc/rfc2119.txt>

498 **9.2 Informative References**

499 [REFERENCE] F. Last author list or standards body, "Title of referenced document",
500 Document Number, Month YYYY, URL (if any)

501 **10. Authors' Addresses**
